G M Pruna, A Pukhov, M Purmohammadi
arXiv:1205.6569, arXiv:1305.3219

Preamble

- Higgs particle found! SM?
- 2HDM excluded?
- not quite
- but parameter space severely constrained
- Look for charged Higgs!

2HDM notation 1

$$V = \frac{\lambda_1}{2}(\Phi_1^\dagger\Phi_1)^2 + \frac{\lambda_2}{2}(\Phi_2^\dagger\Phi_2)^2 + \lambda_3(\Phi_1^\dagger\Phi_1)(\Phi_2^\dagger\Phi_2)$$
$$+ \lambda_4(\Phi_1^\dagger\Phi_2)(\Phi_2^\dagger\Phi_1) + \frac{1}{2}\left[\lambda_5(\Phi_1^\dagger\Phi_2)^2 + \text{h.c.}\right]$$
$$- \frac{1}{2}\left\{m_{11}^2(\Phi_1^\dagger\Phi_1)+\left[m_{12}^2(\Phi_1^\dagger\Phi_2)+\text{h.c.}\right]+m_{22}^2(\Phi_2^\dagger\Phi_2)\right\}$$

No FCNC:

$$\lambda_6 = 0; \quad \lambda_7 = 0$$

Allow CPV: $\lambda_5, \quad m_{12}^2$ complex

2HDM notation 2

$$\Phi_i = \begin{pmatrix} \varphi_i^+ \\ \frac{1}{\sqrt{2}}(v_i + \eta_i + i\chi_i) \end{pmatrix}$$

$$\begin{pmatrix} H_1 \\ H_2 \\ H_3 \end{pmatrix} = R \begin{pmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{pmatrix}$$

$$\eta_3 = -\sin\beta\chi_1 + \cos\beta\chi_2$$

$$R\mathcal{M}^2 R^{\mathrm{T}} = \mathcal{M}^2_{\mathrm{diag}} = \mathrm{diag}(M_1^2, M_2^2, M_3^2)$$

2HDM notation 3

2 vs 3   1 vs 3   1 vs 2

$$R = R_3\,R_2\,R_1 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos\alpha_3 & \sin\alpha_3 \\ 0 & -\sin\alpha_3 & \cos\alpha_3 \end{pmatrix} \begin{pmatrix} \cos\alpha_2 & 0 & \sin\alpha_2 \\ 0 & 1 & 0 \\ -\sin\alpha_2 & 0 & \cos\alpha_2 \end{pmatrix} \begin{pmatrix} \cos\alpha_1 & \sin\alpha_1 & 0 \\ -\sin\alpha_1 & \cos\alpha_1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} c_1\,c_2 & s_1\,c_2 & s_2 \\ -(c_1\,s_2\,s_3 + s_1\,c_3) & c_1\,c_3 - s_1\,s_2\,s_3 & c_2\,s_3 \\ -c_1\,s_2\,c_3 + s_1\,s_3 & -(c_1\,s_3 + s_1\,s_2\,c_3) & c_2\,c_3 \end{pmatrix}$$

PDG convention

$$c_i = \cos\alpha_i,\ s_i = \sin\alpha_i$$

CP-conserving limits:

$$\begin{aligned} &H_1 \text{ odd:} \quad \alpha_2 \simeq \pm\pi/2,\ \alpha_1, \alpha_3 \text{ arbitrary}, \\ &H_2 \text{ odd:} \quad \alpha_2 = 0,\ \alpha_3 = \pi/2,\ \alpha_1 \text{ arbitrary}, \\ &H_3 \text{ odd:} \quad \alpha_2 = \alpha_3 = 0,\ \alpha_1 \text{ arbitrary}. \end{aligned}$$

Yukawa couplings

$$H_j b\bar{b}: \qquad \frac{-ig\, m_b}{2\, m_W} \frac{1}{\cos\beta} \left[R_{j1} - i\gamma_5 \sin\beta R_{j3}\right],$$

$$H_j t\bar{t}: \qquad \frac{-ig\, m_t}{2\, m_W} \frac{1}{\sin\beta} \left[R_{j2} - i\gamma_5 \cos\beta R_{j3}\right].$$

$$H^+ b\bar{t}: \qquad \frac{ig}{2\sqrt{2}\, m_W} V_{tb}[m_b(1+\gamma_5)\tan\beta + m_t(1-\gamma_5)\cot\beta],$$

$$H^- t\bar{b}: \qquad \frac{ig}{2\sqrt{2}\, m_W} V_{tb}^*[m_b(1-\gamma_5)\tan\beta + m_t(1+\gamma_5)\cot\beta].$$

Gauge couplings

$$H_j ZZ: \qquad [\cos\beta R_{j1} + \sin\beta R_{j2}], \quad \text{for } j = 1,$$

$H_1 \to ZZ,\, WW$ **observed (off-shell)**

$H_{2,3} \to ZZ,\, WW$ **not observed (on-shell)**

$$H_j H^\pm W^\mp: \qquad \frac{g}{2}[\mp i(\sin\beta R_{j1} - \cos\beta R_{j2}) + R_{j3}](p^j_\mu - p^\pm_\mu).$$

Enter in total widths: $H_{2,3} \to H_1 Z$

Parameters

Input: $\tan\beta,\ (M_1,\ M_2),\ (M_{H^\pm},\ \mu^2),\ (\alpha_1,\ \alpha_2,\ \alpha_3)$

Reconstruct:

$$M_3^2 = \frac{M_1^2 R_{13}(R_{12}\tan\beta - R_{11}) + M_2^2 R_{23}(R_{22}\tan\beta - R_{21})}{R_{33}(R_{31} - R_{32}\tan\beta)}$$

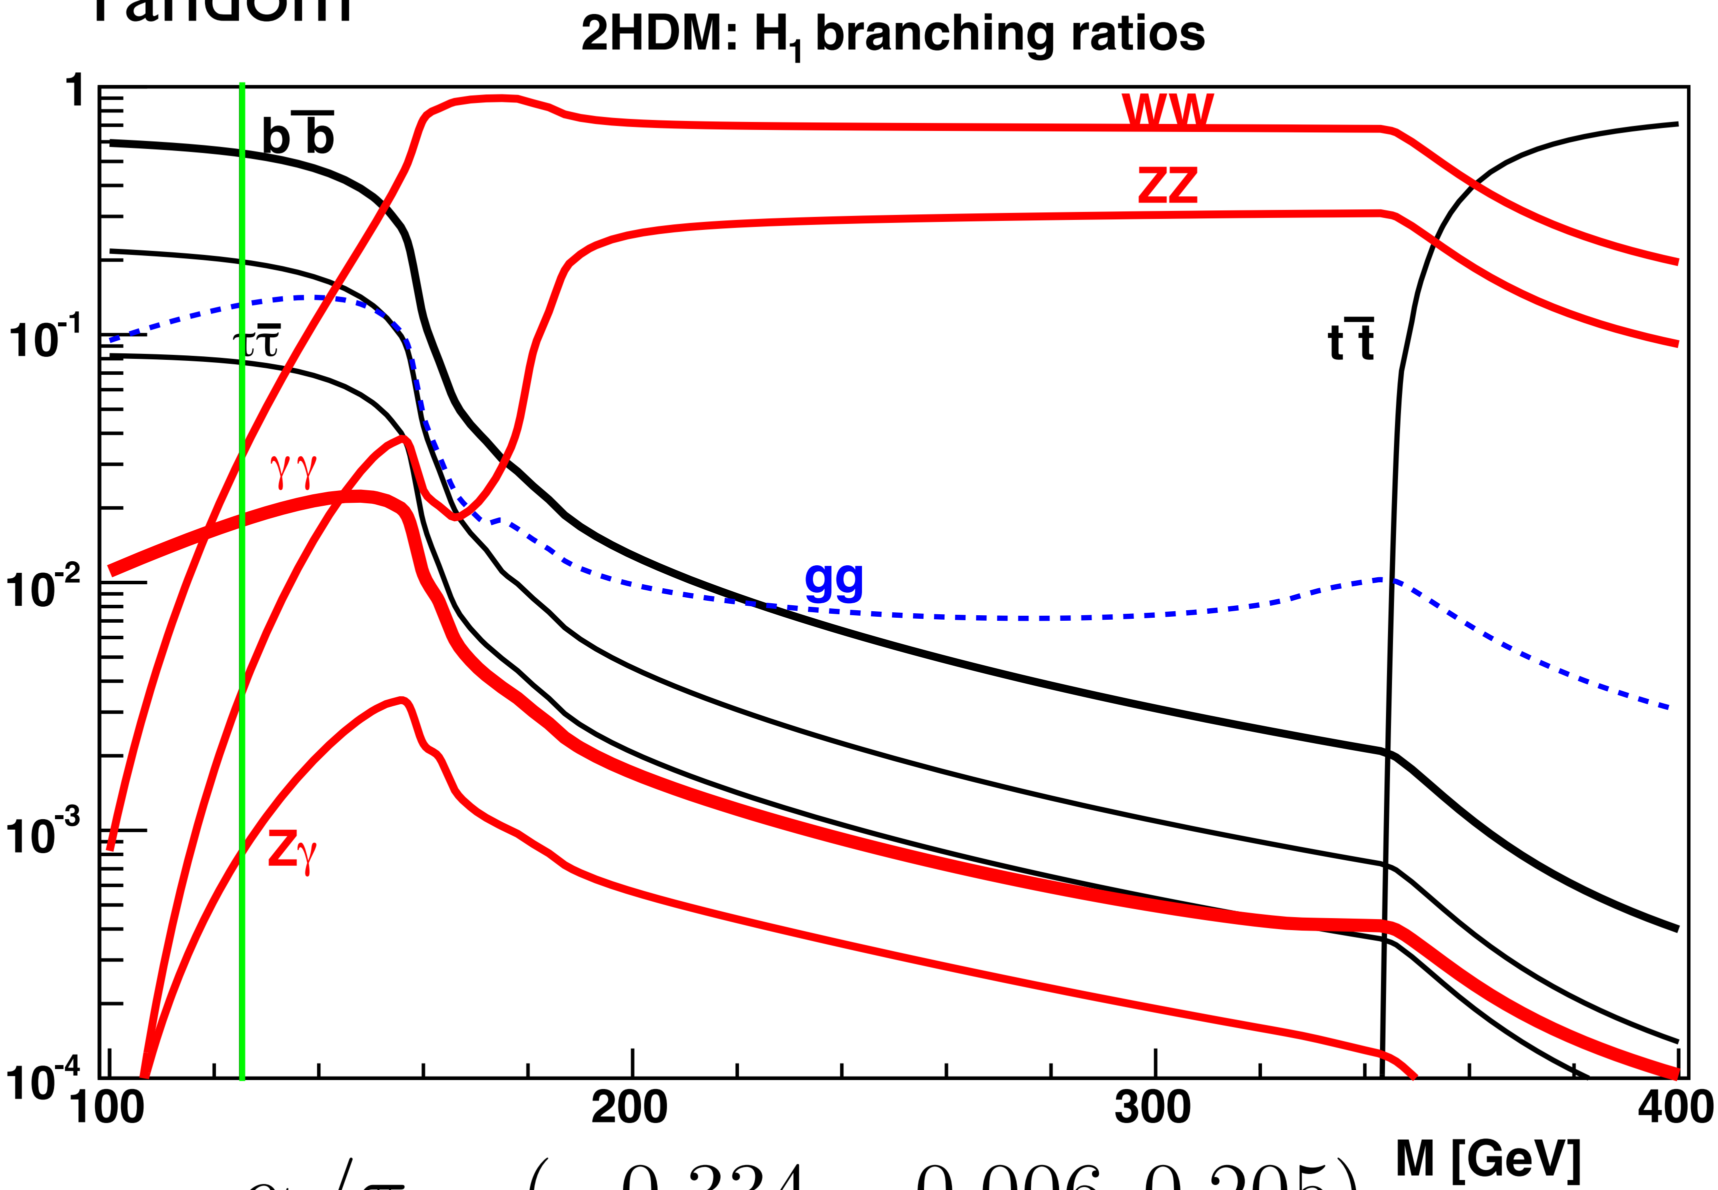
Explicit expressions for

$$\lambda_1, \lambda_2, \lambda_3, \lambda_4, \mathrm{Re}\,\lambda_5, \mathrm{Im}\,\lambda_5$$

in terms of input

Branching ratios

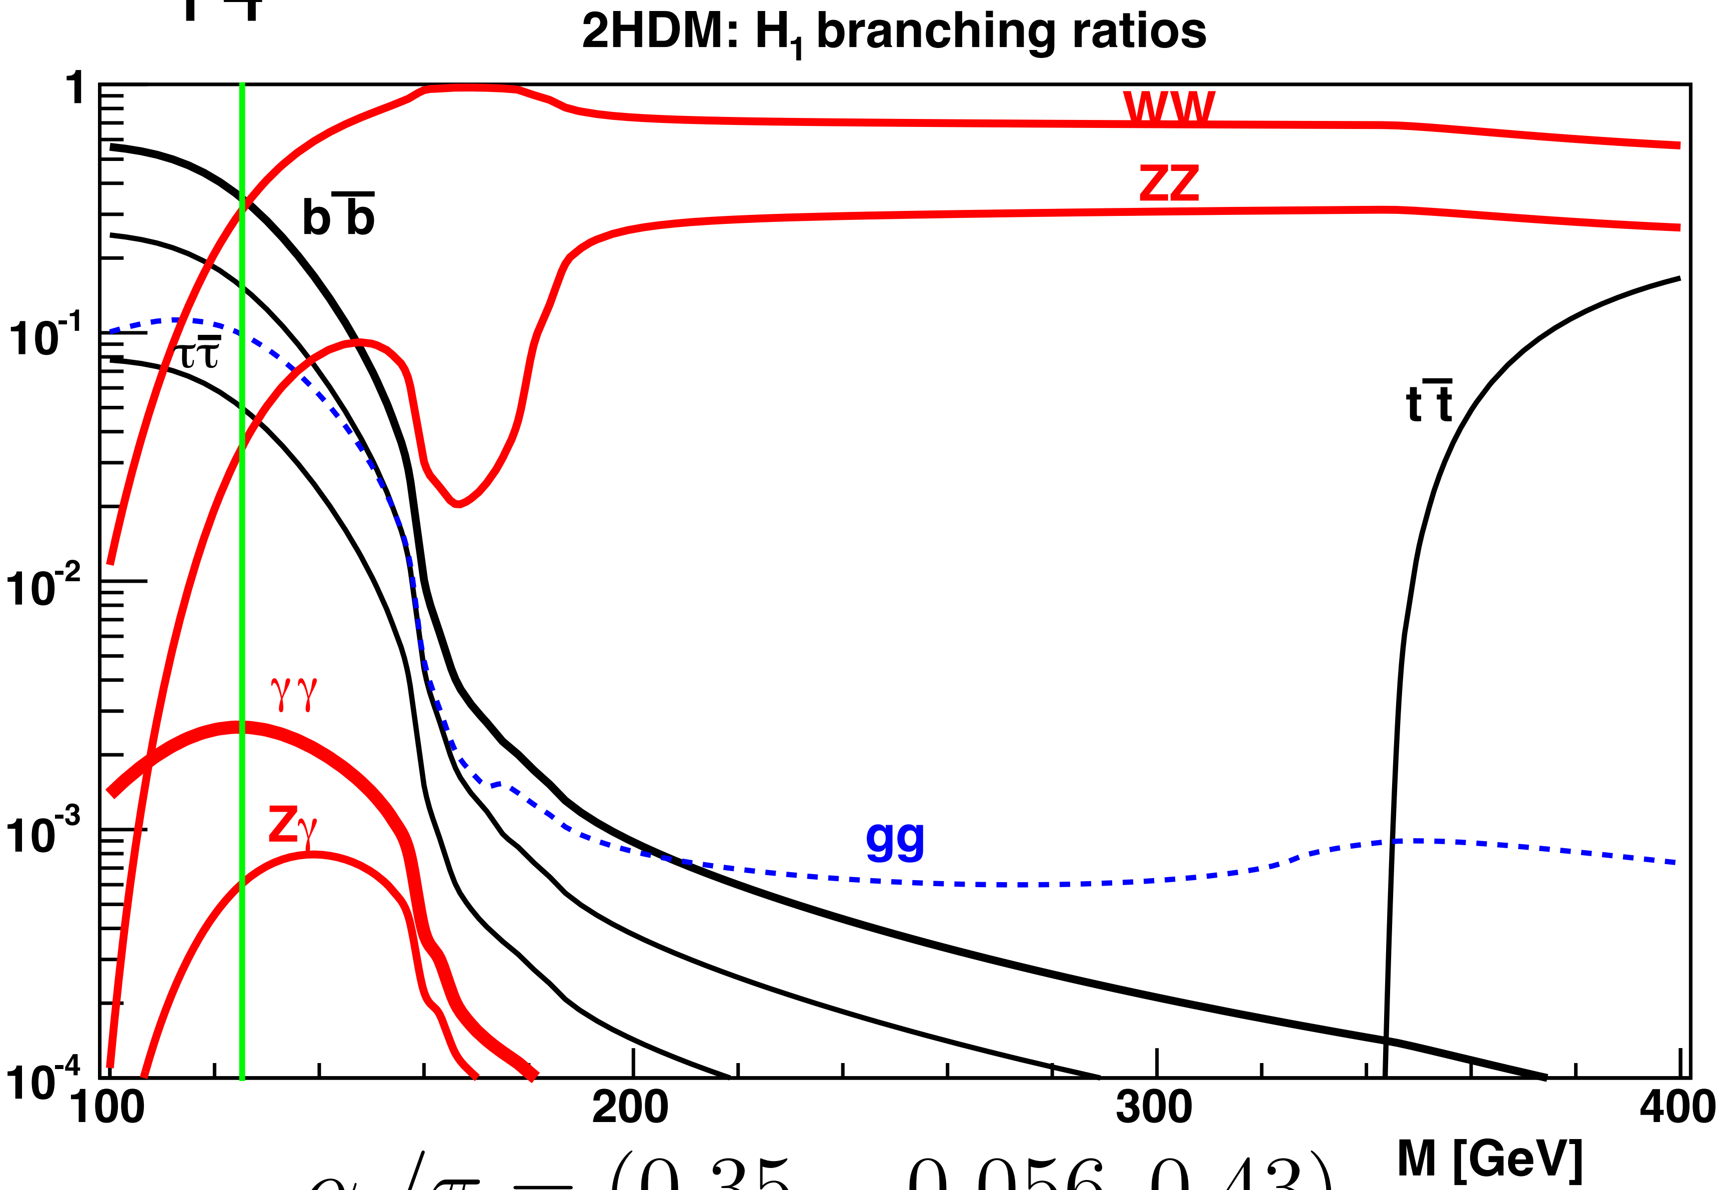
random



$$\alpha_i/\pi = (-0.334, -0.006, 0.205)$$

Branching ratios

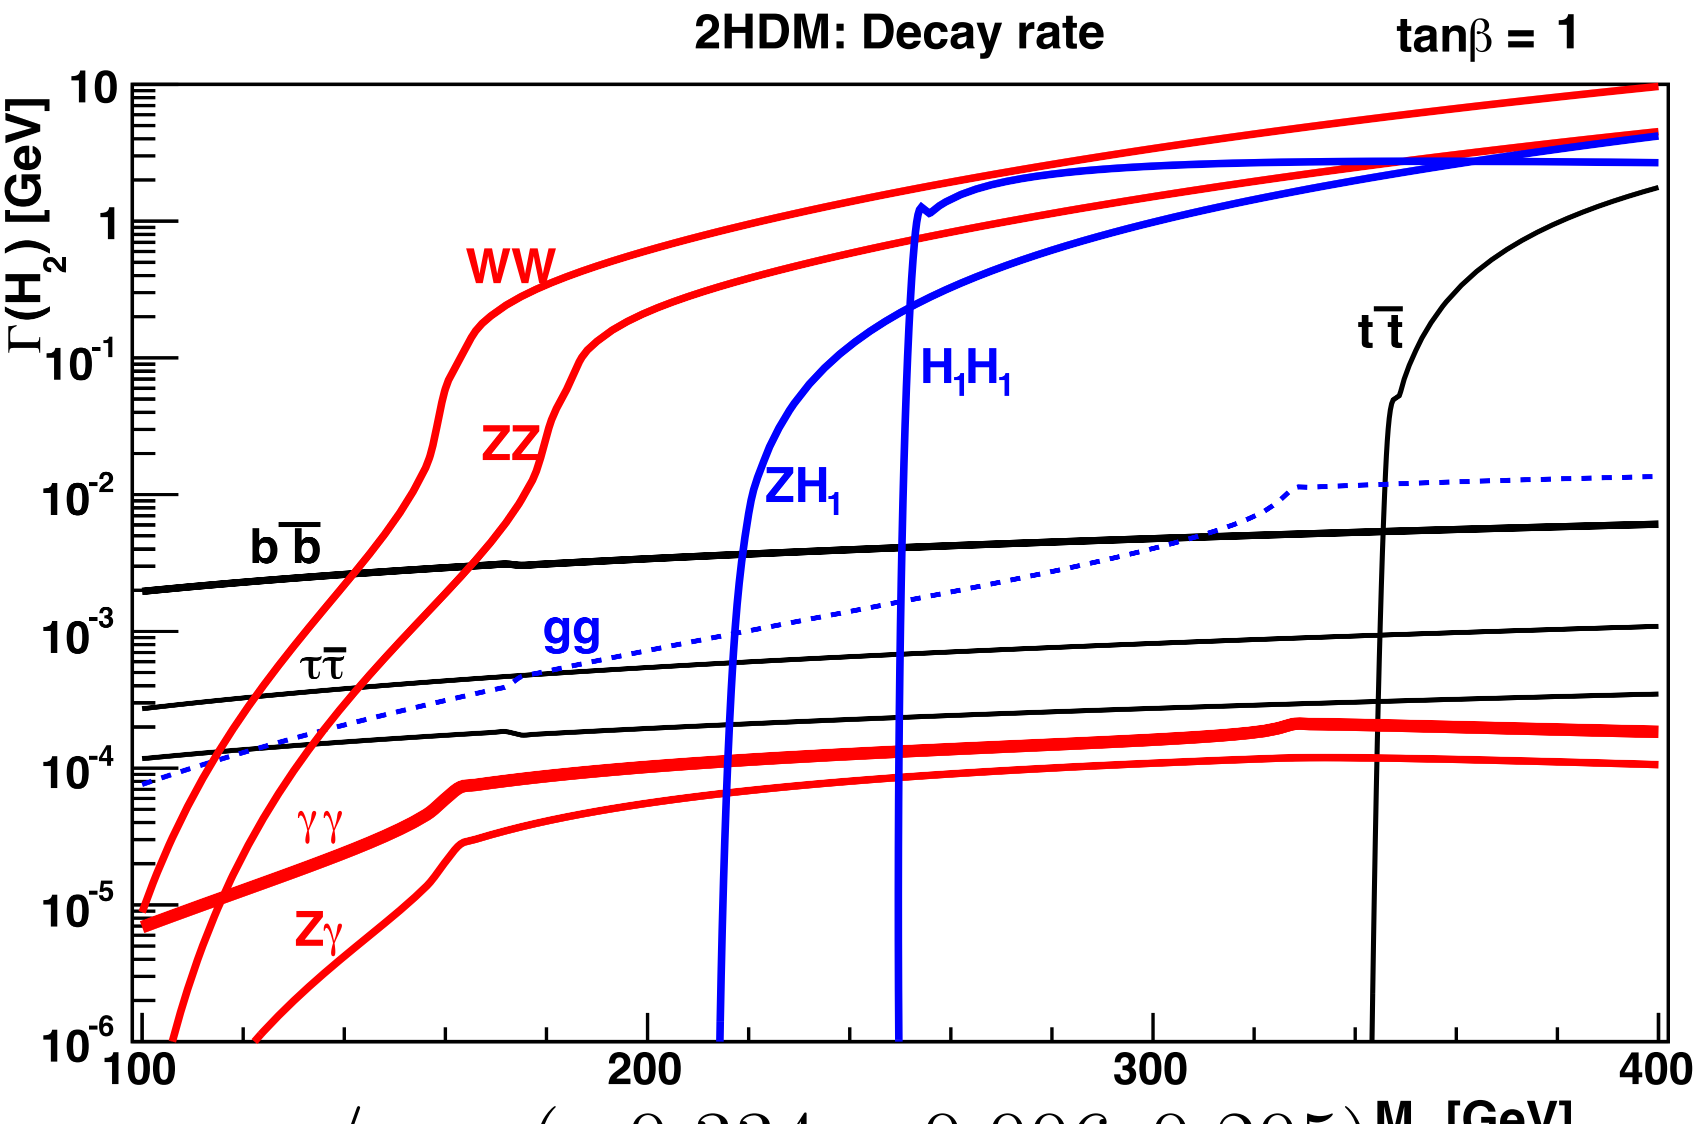
P4



$$\alpha_i/\pi = (0.35, -0.056, 0.43)$$

Decay rates

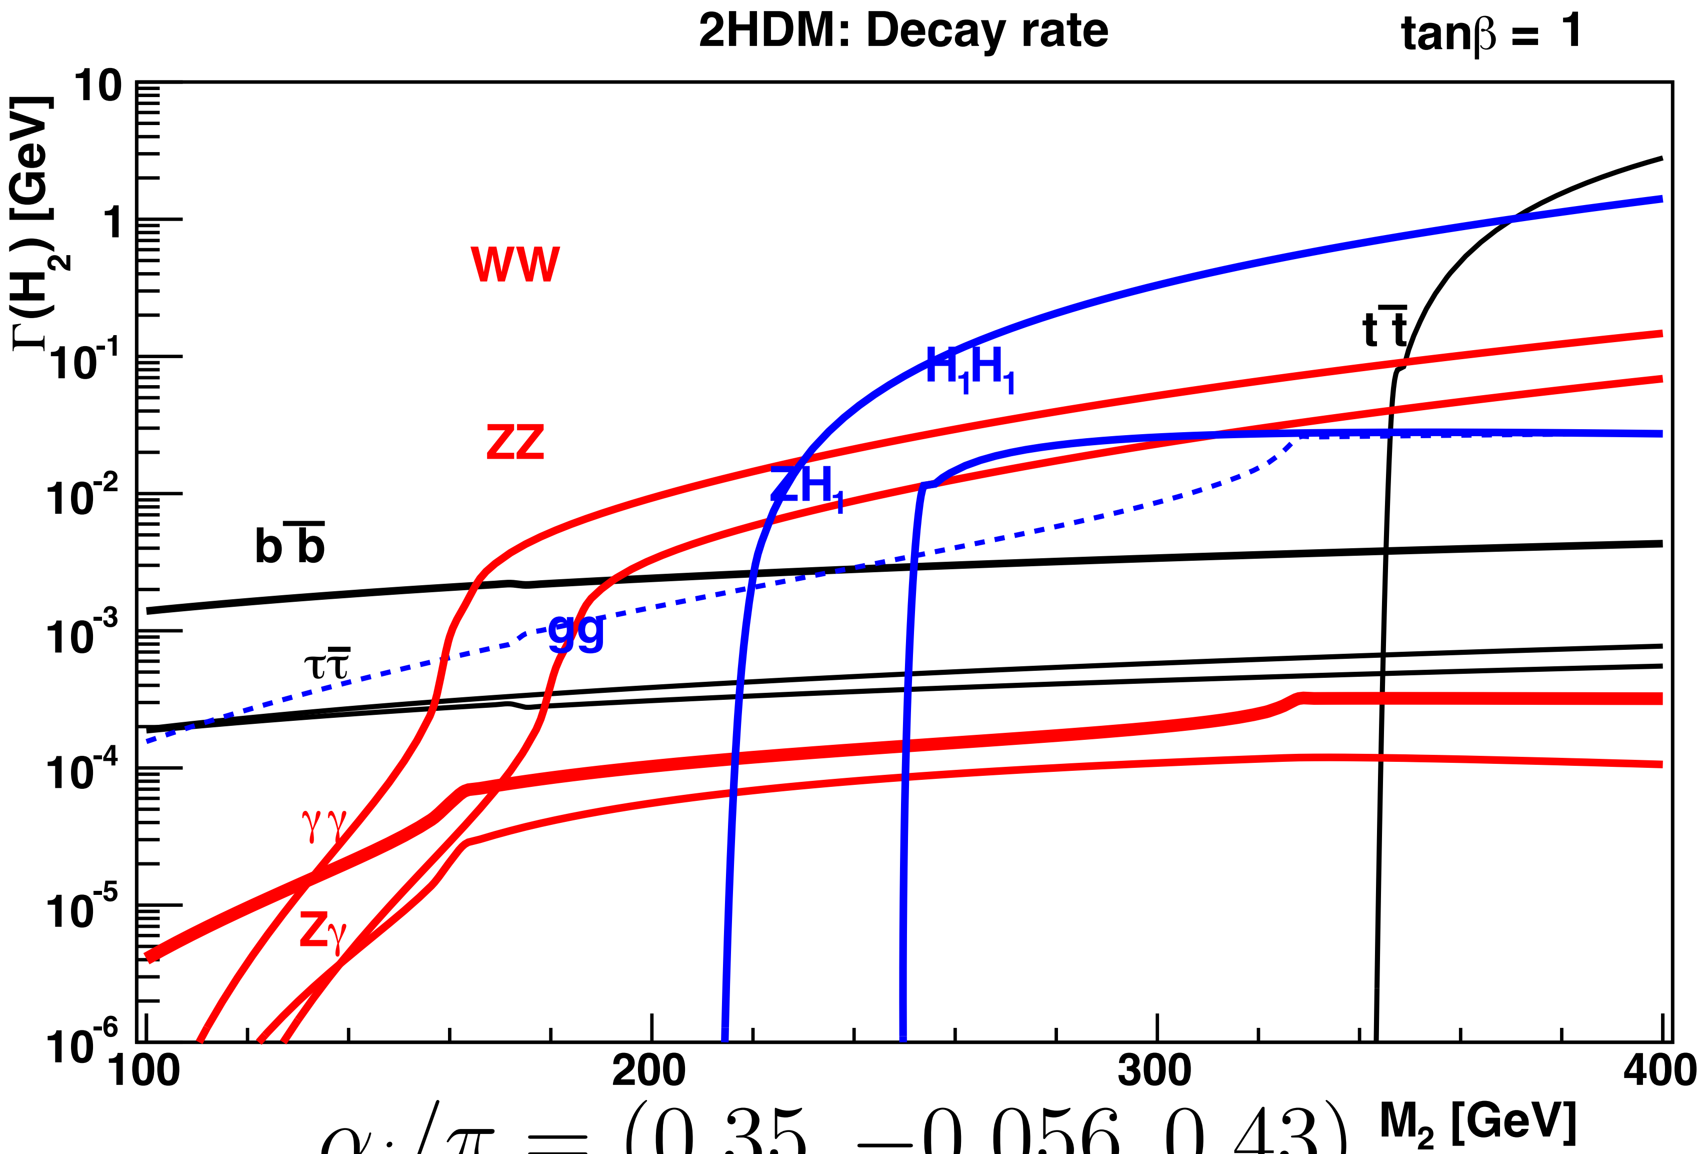
random



$$\alpha_i/\pi = (-0.334, -0.006, 0.205)$$

Decay rates

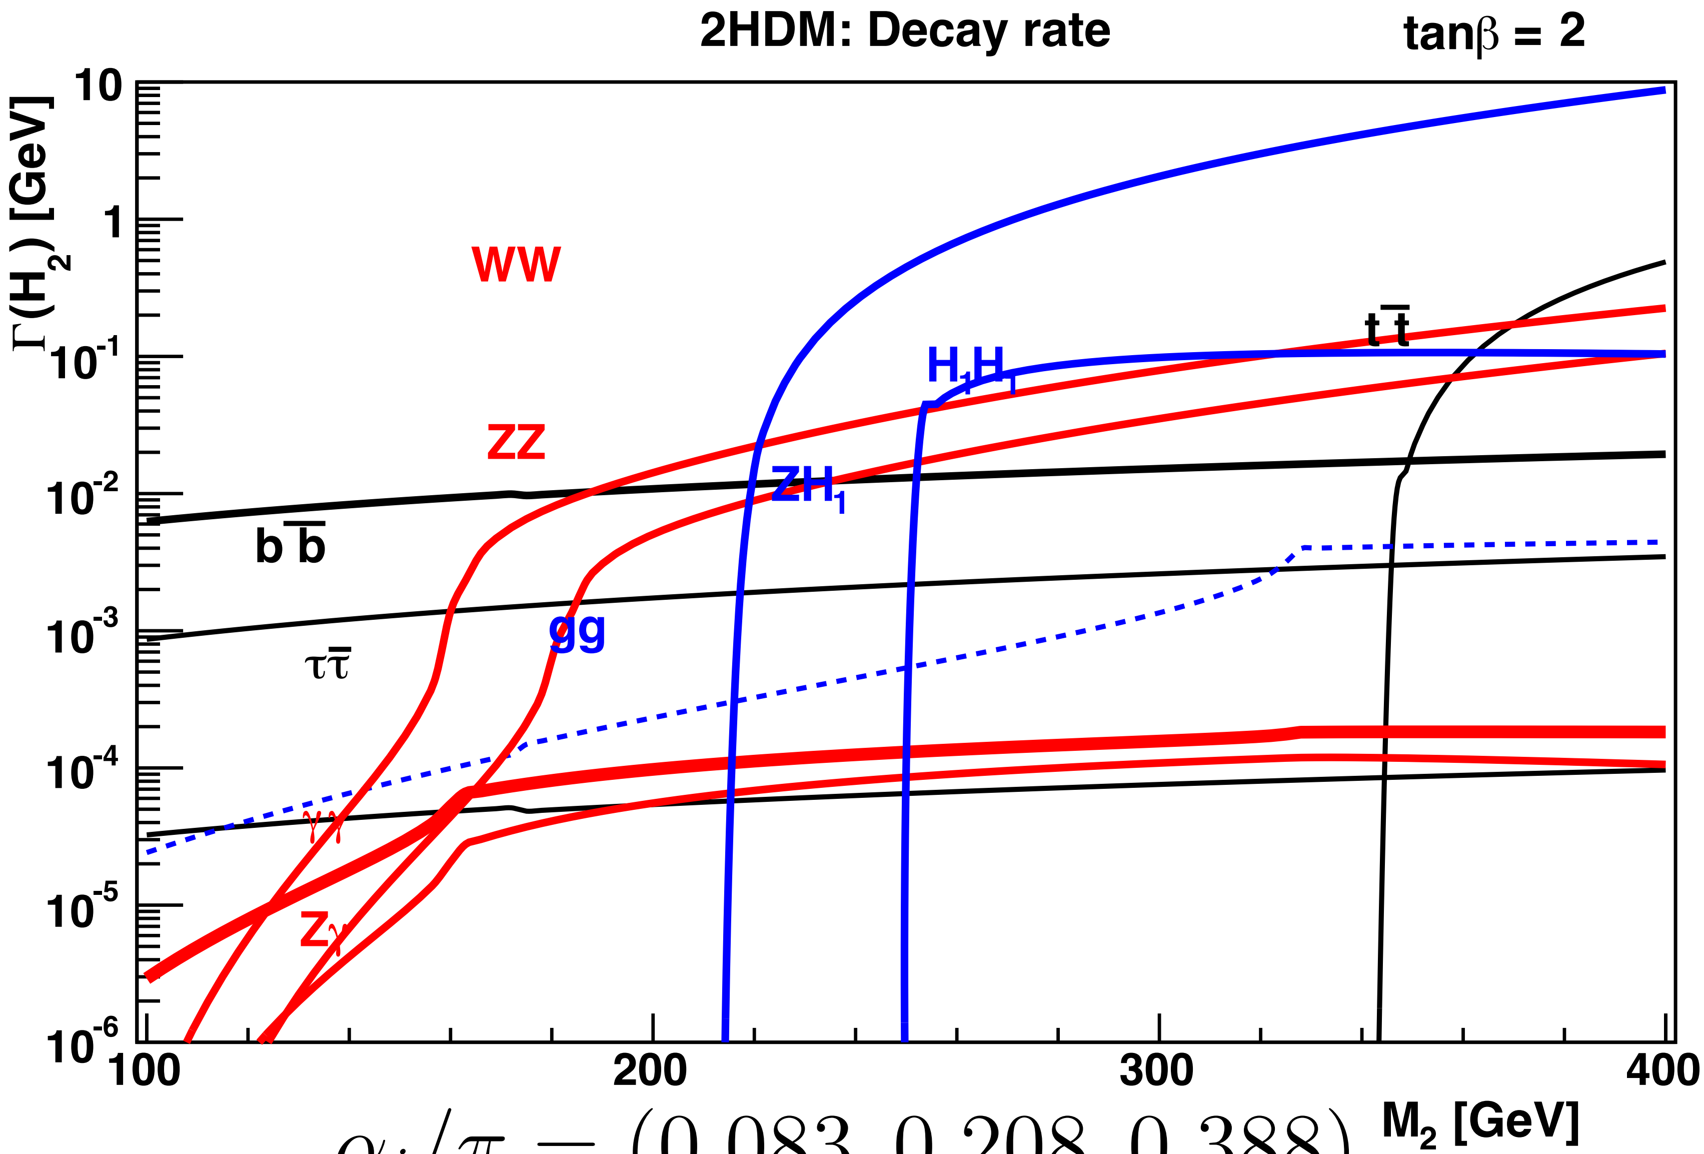
P4



$$\alpha_i/\pi = (0.35, -0.056, 0.43)$$

Decay rates

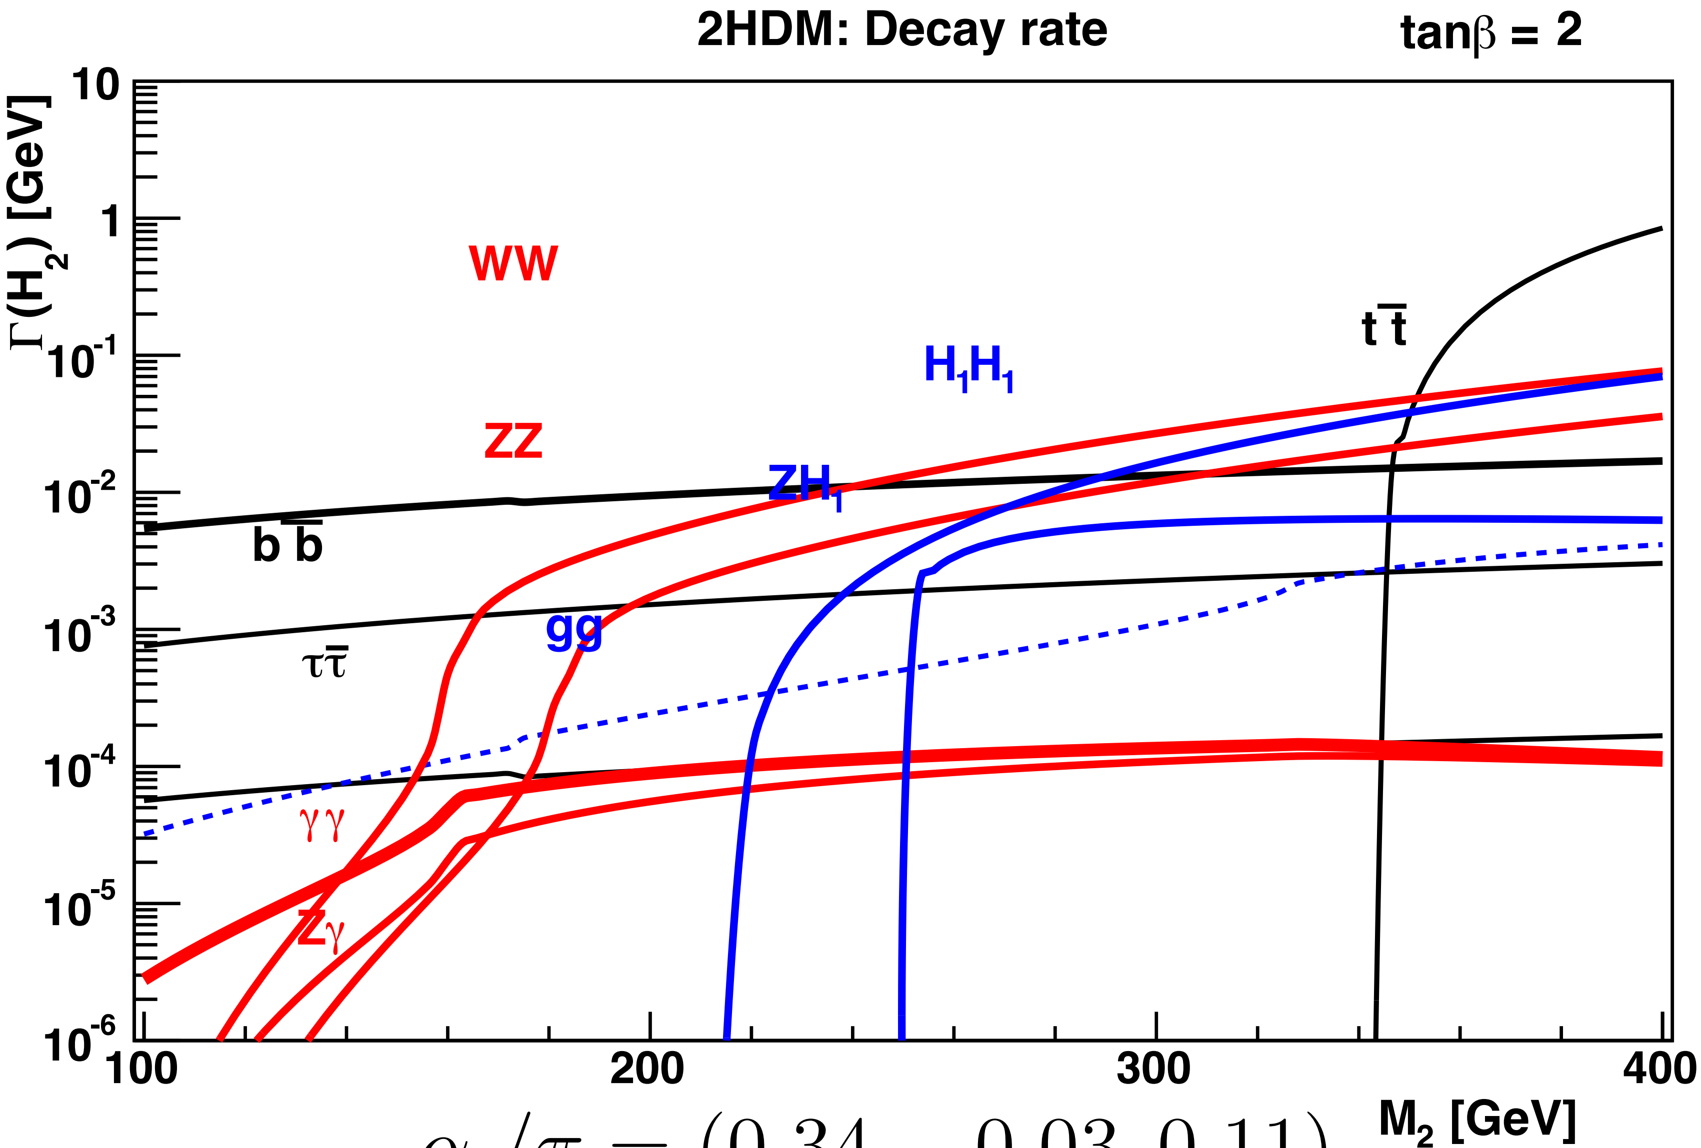
random



$$\alpha_i/\pi = (0.083, 0.208, 0.388)$$

Decay rates

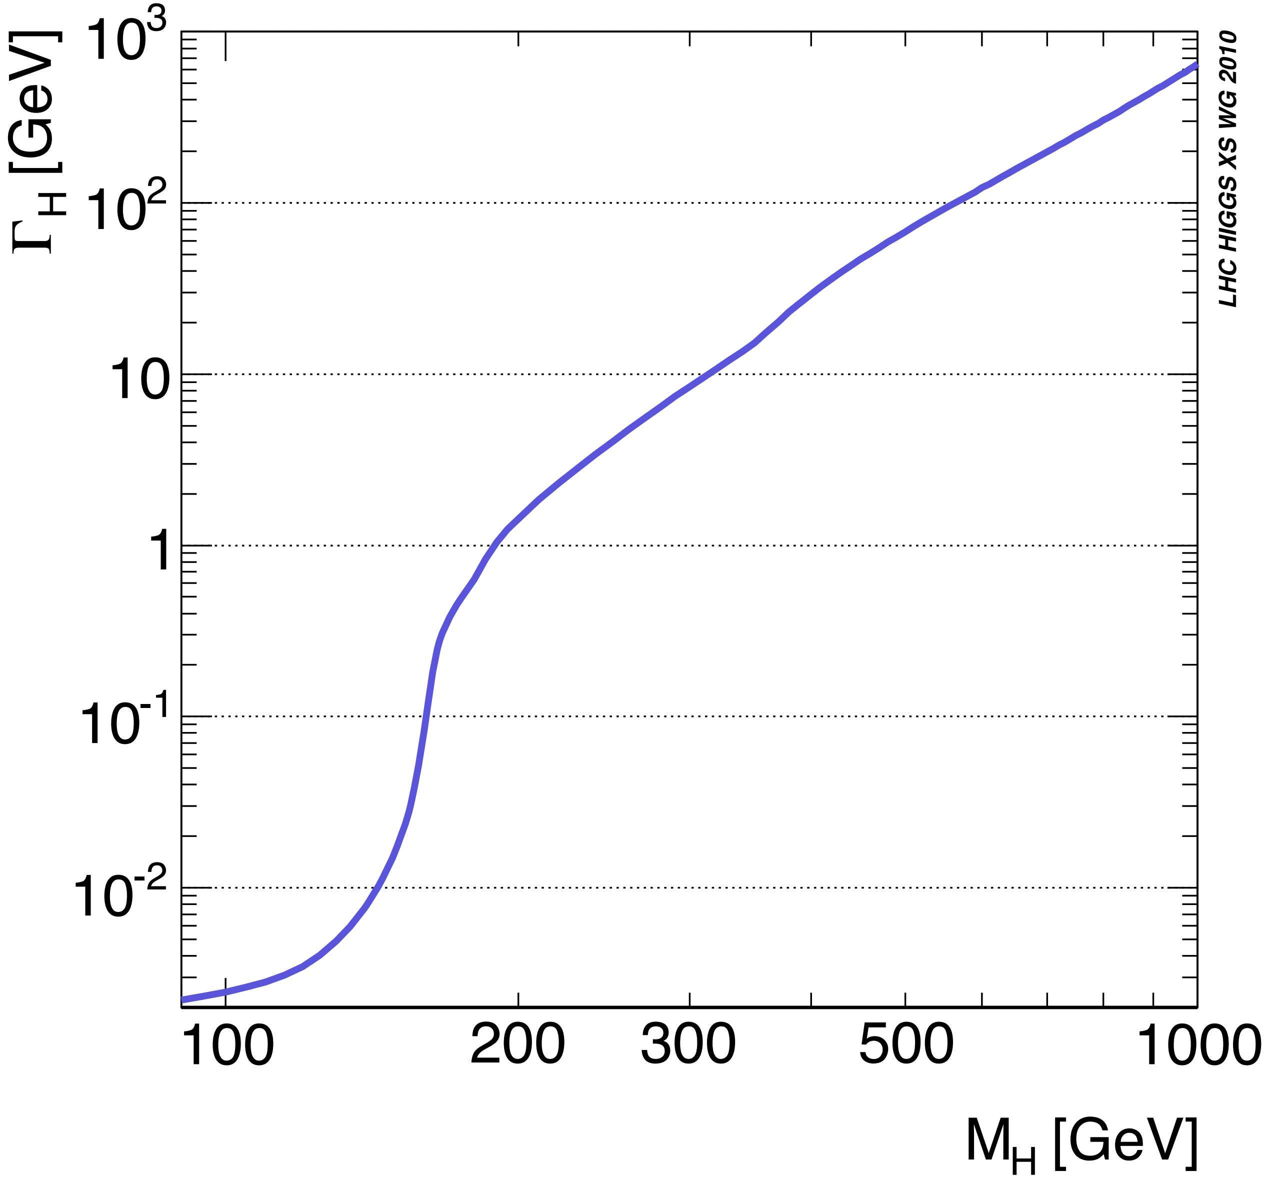
P8



$$\alpha_i/\pi = (0.34, -0.03, 0.11)$$

SM decay rate

has stronger coupling to WW



H_2 (if, for example at 400 GeV) and H_3
must decay more slowly than SM Higgs (at same mass),
in order for model not to be excluded by LHC data

Constraints-theory

- Positivity
  - Explicit conditions
- Unitarity
  - Explicit conditions
- Perturbativity
- Global minimum
  - Three coupled cubic equations

Constraints-experiment

- $b \to s\gamma$
- $\Gamma(Z \to b\bar{b})$
- $B \to \tau\nu(X)$, $B \to D\tau\nu$, $D \to \tau\nu$
- $B_0 \leftrightarrow \bar{B}_0$
- $B_{d,s} \to \mu^+\mu^-$
- EW constraints: S, T
- Electron EDM
- LHC: $H_1 \to \gamma\gamma$
- LHC: $H_{2,3} \to W^+W^-$

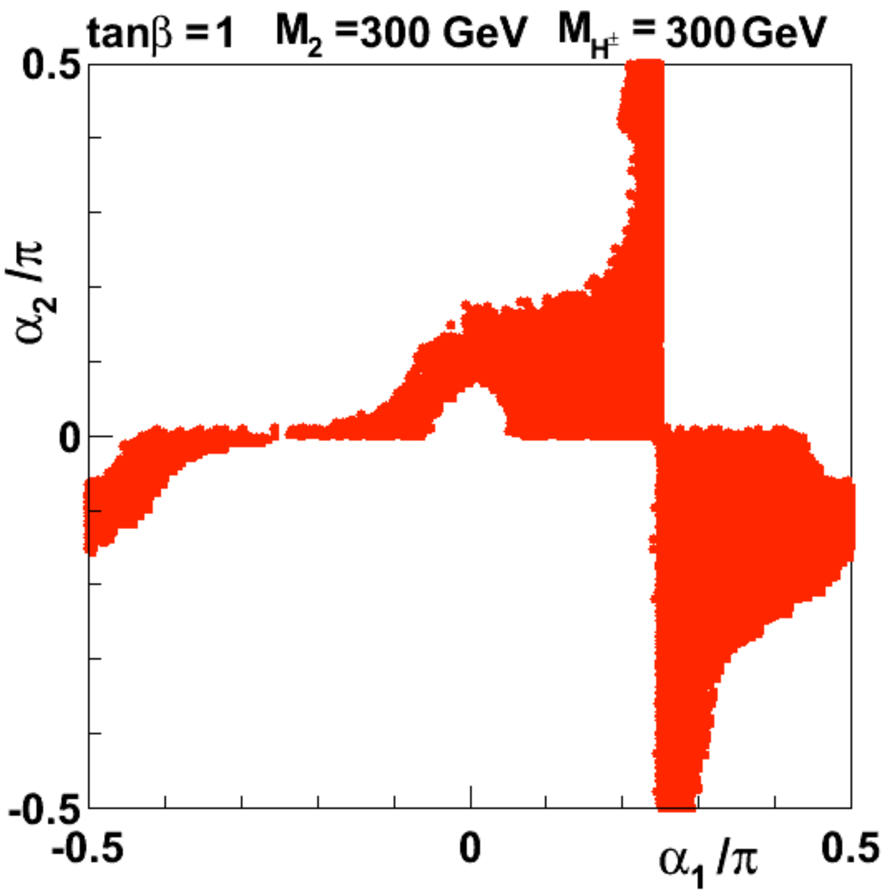
Parameters

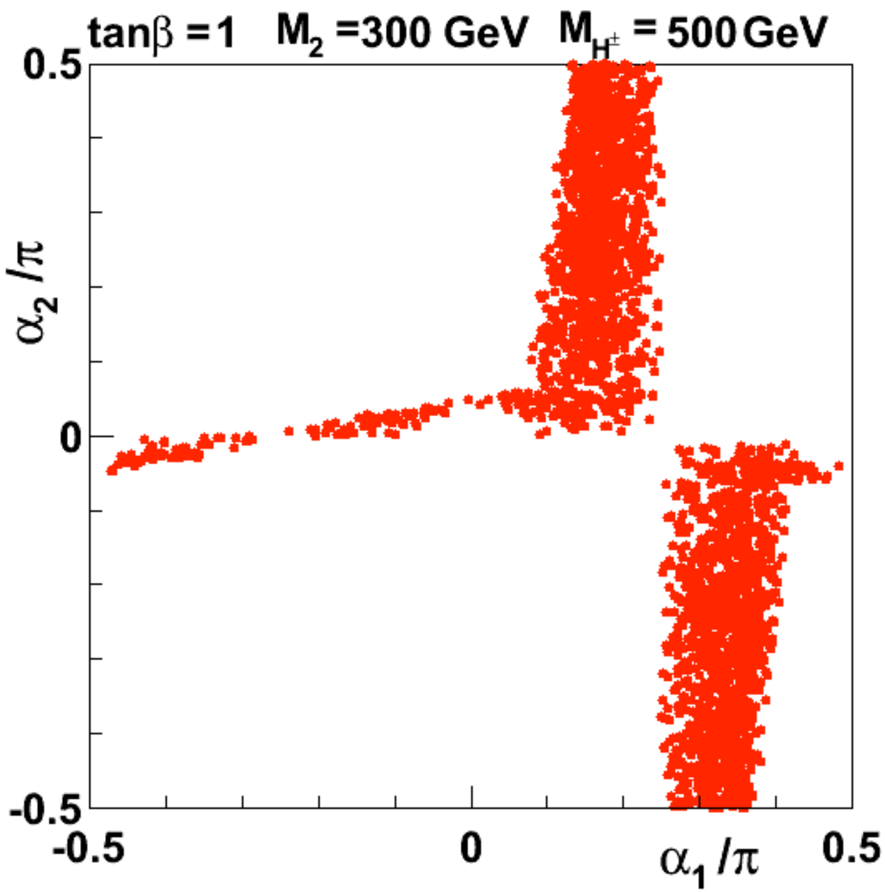
Input: $\tan\beta,\ (M_1,\ M_2),\ (M_{H^\pm},\ \mu^2),\ (\alpha_1,\ \alpha_2,\ \alpha_3)$

Typically:	step	fix	step	scan

Allowed regions (red)

Ignore LHC (apologies)





LHC constraints

1 $gg \to H_1 \to \gamma\gamma$

$$R_{\gamma\gamma} = \frac{\Gamma(H_1 \to gg)\mathrm{BR}(H_1 \to \gamma\gamma)}{\Gamma(H_{\mathrm{SM}} \to gg)\mathrm{BR}(H_{\mathrm{SM}} \to \gamma\gamma)}$$

Triangle diagrams modified by couplings, also axial term

$$0.5 \leq R_{\gamma\gamma} \leq 2.0$$

---

2 $gg \to H_{2,3} \to W^+W^-$

$$R_{ZZ} = \frac{\Gamma(H_j \to gg)\mathrm{BR}(H_j \to ZZ)}{\Gamma(H_{\mathrm{SM}} \to gg)\mathrm{BR}(H_{\mathrm{SM}} \to ZZ)}$$

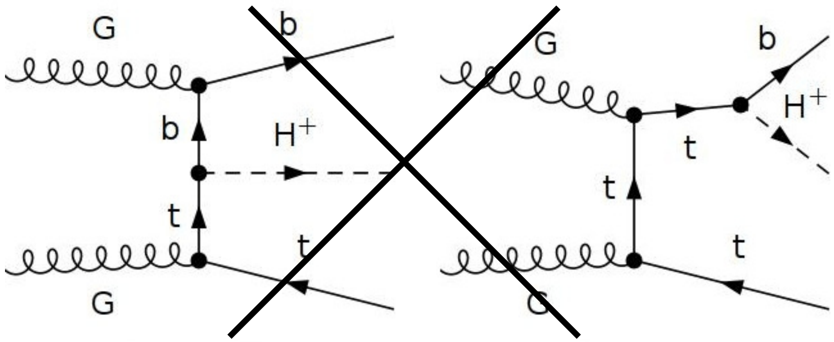
(b)

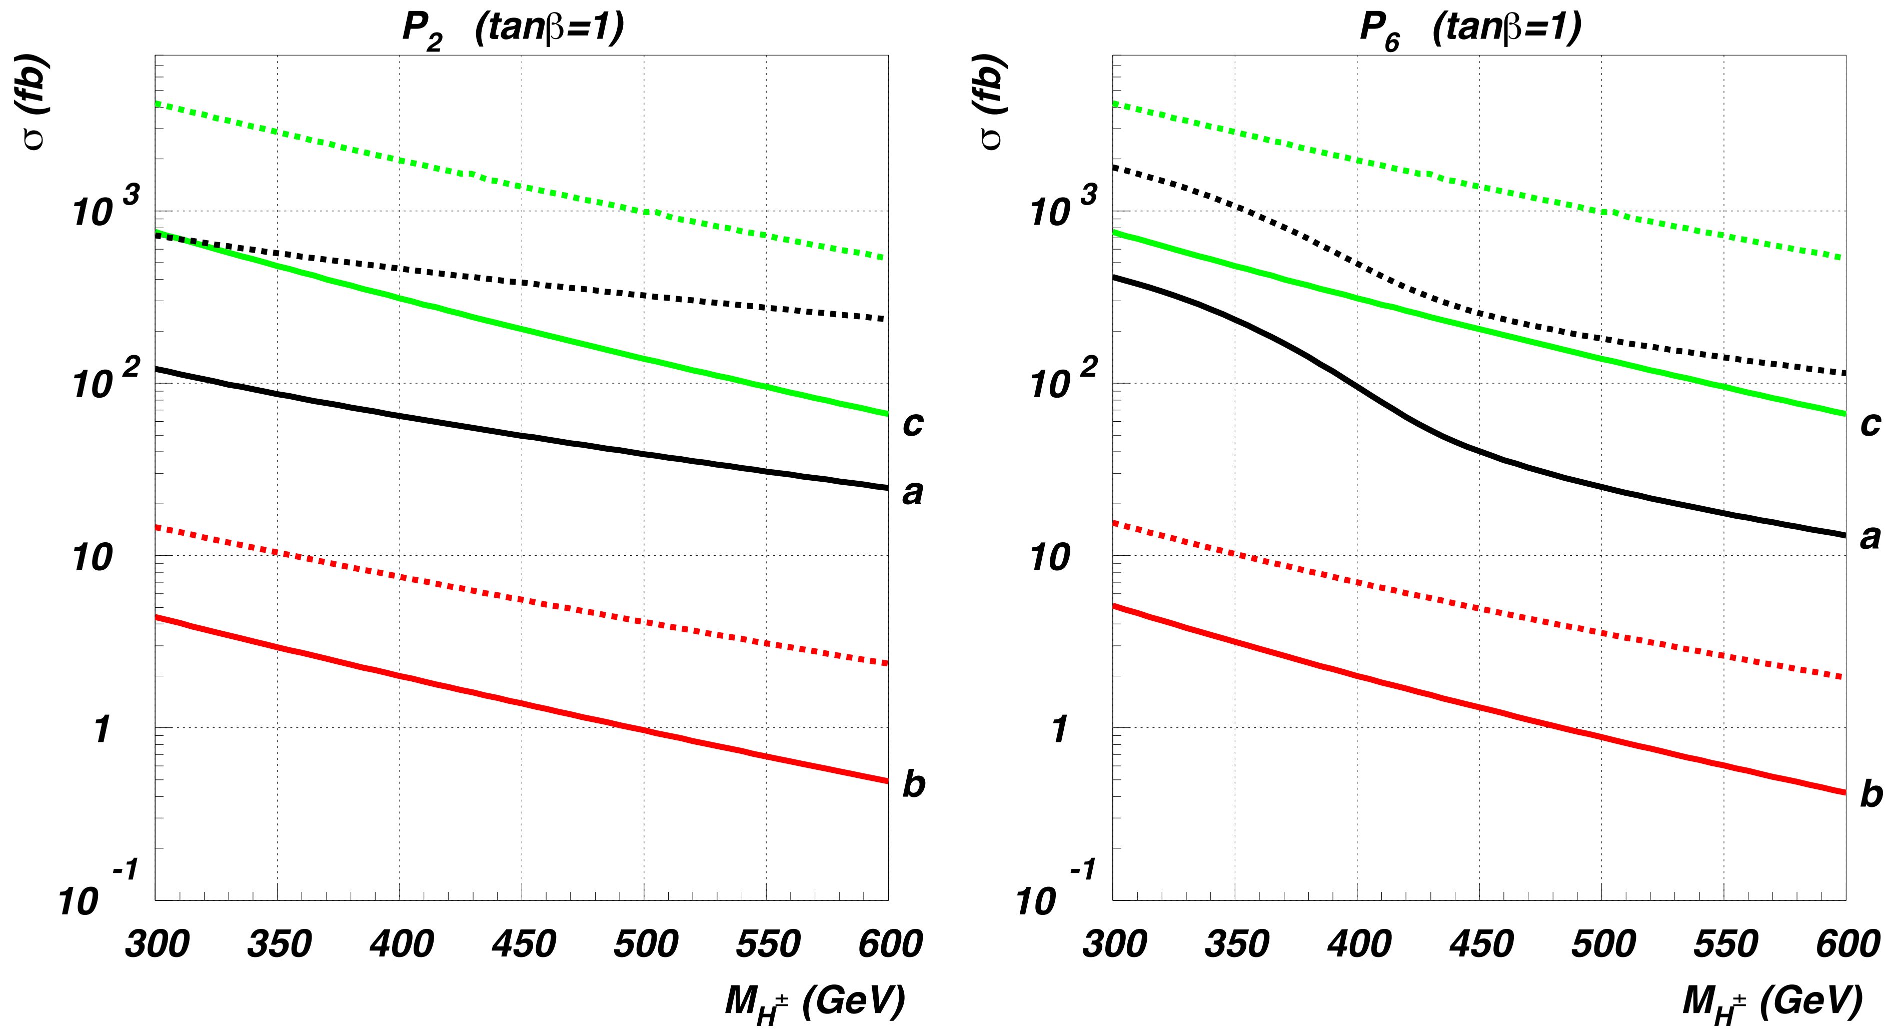
irreducible background



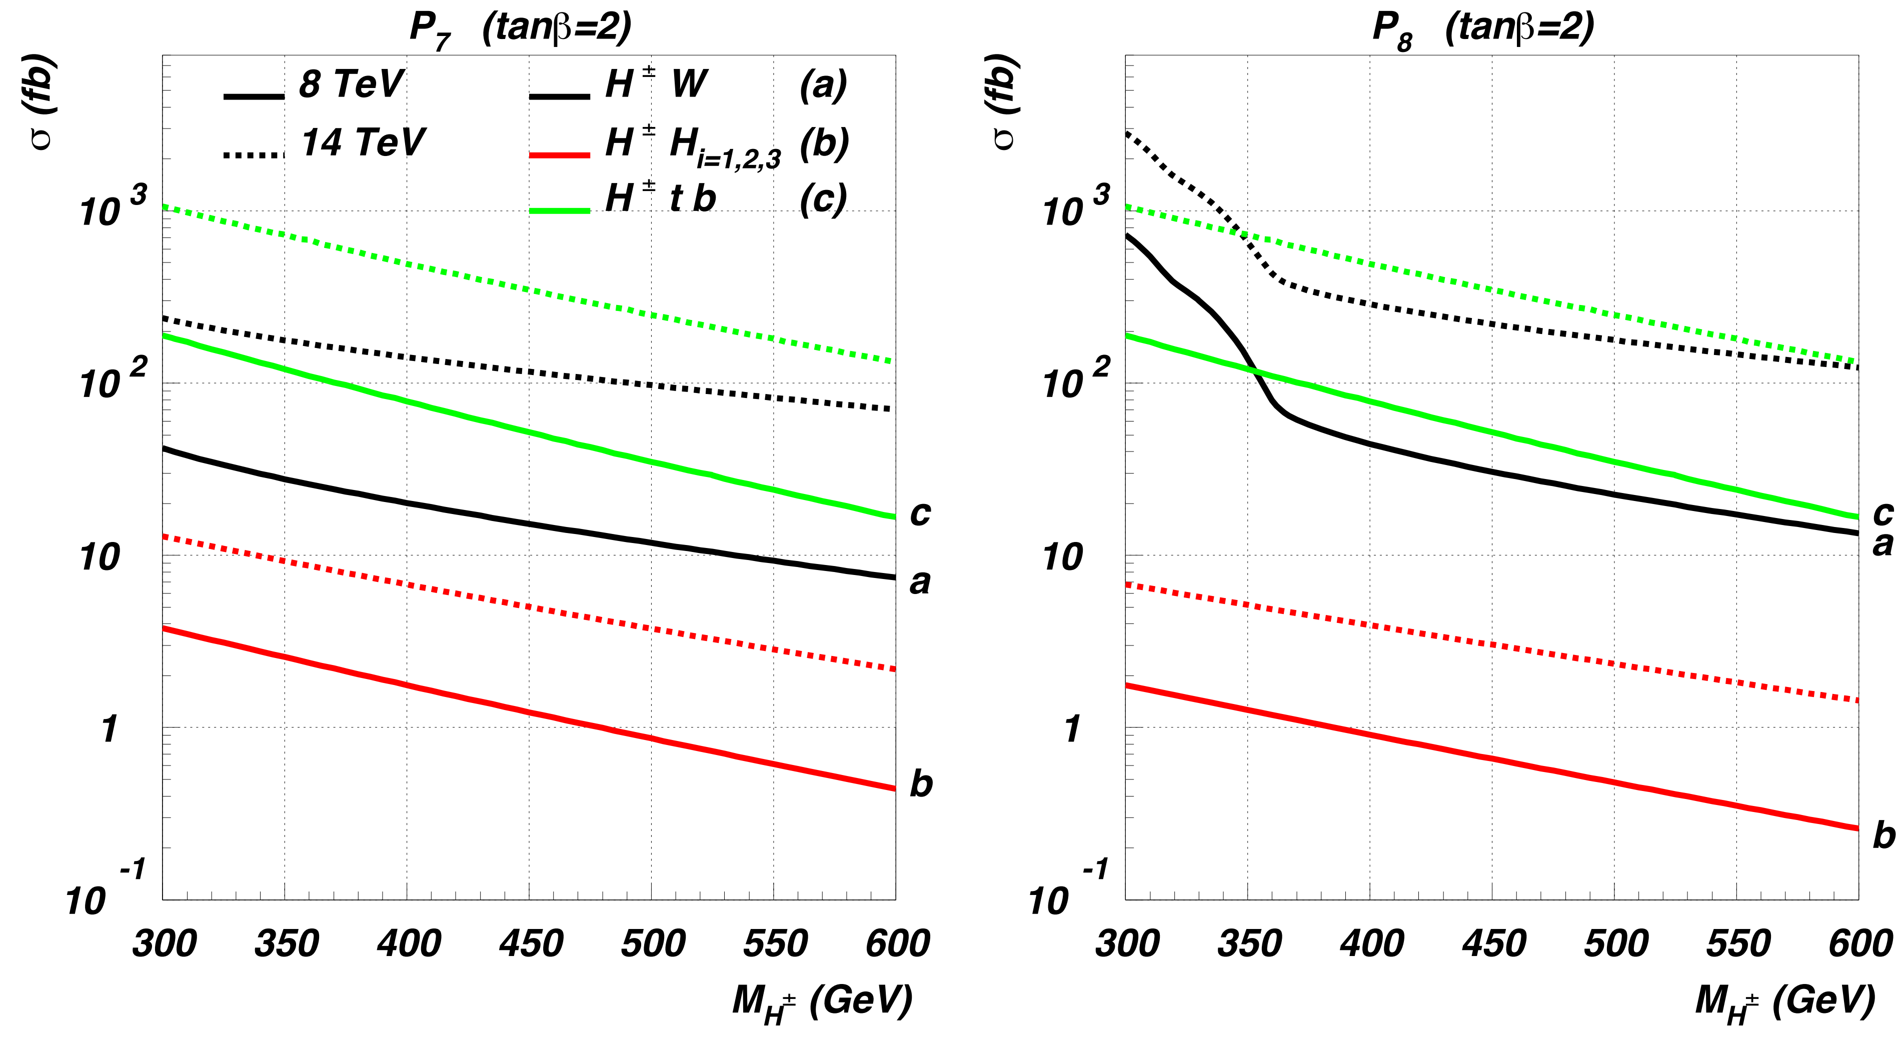
(c)

$$t \to bW$$

Cross sections: legend next page



Cross sections:



Background

signal! (arrow pointing to W^+)

- $t\bar{t} \to b\bar{b}W^+W^-$
- cross section larger by factor 10^3
- impose generic cuts, BG reduction by factor 40, signal reduction by 2-3

Generic cuts

1) **Kinematics:** standard detector cuts

$$p_\ell^T > 15 \text{ GeV}, \qquad |\eta_\ell| < 2.5,$$
$$p_j^T > 20 \text{ GeV}, \qquad |\eta_j| < 3,$$
$$|\Delta R_{jj}| > 0.5, \qquad |\Delta R_{\ell j}| > 0.5;$$

2) **light Higgs reconstruction:**

$$\left| M(b\bar{b}) - 125 \text{ GeV} \right| < 20 \text{ GeV}\,;$$

3) **hadronic W reconstruction ($W_h \to jj$):**

$$|M(jj) - 80 \text{ GeV}| < 20 \text{ GeV}\,;$$

Generic cuts

4) **top veto**: if $\Delta R(b_1, W_h) < \Delta R(b_2, W_h)$, then

$$M(b_1 jj) > 200 \text{ GeV}\,, \qquad M_T(b_2 \ell \nu) > 200 \text{ GeV}\,,$$

otherwise $1 \leftrightarrow 2$;

disfavor top, for each b-quark separately

5) **same-hemisphere b quarks:**

$$\frac{\mathbf{p}_{b_1}}{|\mathbf{p}_{b_1}|} \cdot \frac{\mathbf{p}_{b_2}}{|\mathbf{p}_{b_2}|} > 0\,.$$

Additional anti-top cut

Idea: Since $M_{H^\pm} > m_t$

One of the W's should form
high invariant mass with $b\bar{b}$ pair

2HDM Conclusions

- 2HDM II parameter space is severely constrained by LHC data
- Parts of 2HDM II parameter space are still open
- SM would be excluded by charged Higgs discovery
- $pp \to \underbrace{jj}_{W}\underbrace{\ell^{\pm}\nu}_{W}\underbrace{b\bar{b}}_{H_1}$ channel allows detection in part of parameter space

The Extension
Scalar DM

- "Inert (Scalar) Doublet Model (IDM)", Barbieri et al, 2006

  Extend SM with additional scalar doublet, unbroken Z_2 symmetry makes lightest "odd" particle stable. No vev, no direct coupling to SM matter.

- "CP-violating Inert Doublet Model", Grzadkowski et al, 2009

  Extend 2HDM with additional scalar doublet, unbroken Z_2 symmetry makes lightest "odd" particle stable. No vev, no direct coupling to SM matter.

IDM2: 2HDM + inert doublet

Grzadkowski et al, 2009

Motivation: IDM + CP violation

Fields:

$$\Phi_1 = \begin{pmatrix} \varphi_1^+ \\ (v_1 + \eta_1 + i\chi_1)/\sqrt{2} \end{pmatrix}, \quad \Phi_2 = \begin{pmatrix} \varphi_2^+ \\ (v_2 + \eta_2 + i\chi_2)/\sqrt{2} \end{pmatrix}$$

$$\eta = \begin{pmatrix} \eta^+ \\ (S + iA)/\sqrt{2} \end{pmatrix}$$

Coupling:

Potential:

$$V(\Phi_1, \Phi_2, \eta) = V_{12}(\Phi_1, \Phi_2) + V_3(\eta) + V_{123}(\Phi_1, \Phi_2, \eta)$$

$$V_{12}(\Phi_1, \Phi_2) = -\frac{1}{2}\left\{m_{11}^2 \Phi_1^\dagger \Phi_1 + m_{22}^2 \Phi_2^\dagger \Phi_2 + \left[m_{12}^2 \Phi_1^\dagger \Phi_2 + \text{h.c.}\right]\right\}$$

(standard)

$$+ \frac{\lambda_1}{2}(\Phi_1^\dagger \Phi_1)^2 + \frac{\lambda_2}{2}(\Phi_2^\dagger \Phi_2)^2 + \lambda_3(\Phi_1^\dagger \Phi_1)(\Phi_2^\dagger \Phi_2)$$

$$+ \lambda_4(\Phi_1^\dagger \Phi_2)(\Phi_2^\dagger \Phi_1) + \frac{1}{2}\left[\lambda_5(\Phi_1^\dagger \Phi_2)^2 + \text{h.c.}\right]$$

$$V_3(\eta) = m_\eta^2 \eta^\dagger \eta + \frac{\lambda_\eta}{2}(\eta^\dagger \eta)^2$$

Coupling:

$$V_{123}(\Phi_1, \Phi_2, \eta) = \lambda_{1133}(\Phi_1^\dagger \Phi_1)(\eta^\dagger \eta) + \lambda_{2233}(\Phi_2^\dagger \Phi_2)(\eta^\dagger \eta)$$

(most general)

$$+ \lambda_{1331}(\Phi_1^\dagger \eta)(\eta^\dagger \Phi_1) + \lambda_{2332}(\Phi_2^\dagger \eta)(\eta^\dagger \Phi_2)$$

$$+ \tfrac{1}{2}\left[\lambda_{1313}(\Phi_1^\dagger \eta)^2 + \text{h.c.}\right] + \tfrac{1}{2}\left[\lambda_{2323}(\Phi_2^\dagger \eta)^2 + \text{h.c.}\right]$$

Many parameters...

Many parameters! Simplify!

"Dark democracy":
$$\lambda_a \equiv \lambda_{1133} = \lambda_{2233},$$
$$\lambda_b \equiv \lambda_{1331} = \lambda_{2332},$$
$$\lambda_c \equiv \lambda_{1313} = \lambda_{2323} \text{ (real)}.$$

Masses of inert sector:

$$M_{\eta^\pm}^2 = m_\eta^2 + \tfrac{1}{2}\lambda_a v^2,$$
$$M_S^2 = m_\eta^2 + \tfrac{1}{2}(\lambda_a + \lambda_b + \lambda_c)v^2 = M_{\eta^\pm}^2 + \tfrac{1}{2}(\lambda_b + \lambda_c)v^2,$$
$$M_A^2 = m_\eta^2 + \tfrac{1}{2}(\lambda_a + \lambda_b - \lambda_c)v^2 = M_{\eta^\pm}^2 + \tfrac{1}{2}(\lambda_b - \lambda_c)v^2$$

Important:
These $\lambda_{a,b,c}$ characterize coupling of inert sector to non-inert sector, and also mass splitting in inert sector

Higgs portal

- Coupling of scalars: Higgs $\longleftrightarrow$ DM

$$\lambda_L \equiv \tfrac{1}{2}(\lambda_a + \lambda_b + \lambda_c) = \frac{M_S^2 - m_\eta^2}{v^2}$$

Constraints

- positivity (rather complicated), 20% excluded
- unitarity, 60% excluded
- global minimum, 10% excluded
- additional 2HDM constraints: $T, \quad b \to s\gamma$ etc
- DM

determined by MicrOMEGAs

EW "precision data"

Positivity

Define:

$$\lambda_x = \lambda_3 + \min\left(0, \lambda_4 - |\lambda_5|\right)$$
$$\lambda_y = \lambda_{1133} + \min\left(0, \lambda_{1331} - |\lambda_{1313}|\right)$$
$$\lambda_z = \lambda_{2233} + \min\left(0, \lambda_{2332} - |\lambda_{2323}|\right)$$

$$\lambda_1 > 0, \quad \lambda_2 > 0, \quad \lambda_\eta > 0, \quad \lambda_x > -\sqrt{\lambda_1 \lambda_2}$$

$$\lambda_y > -\sqrt{\lambda_1 \lambda_\eta}, \quad \lambda_z > -\sqrt{\lambda_2 \lambda_\eta}$$

Plus additional constraint, which in the case of Dark democracy $\lambda_y = \lambda_z$ takes the form:

$$\lambda_y \geq 0 \vee \left(\lambda_\eta \lambda_x - \lambda_y^2 > -\sqrt{(\lambda_\eta \lambda_1 - \lambda_y^2)(\lambda_\eta \lambda_2 - \lambda_y^2)}\right)$$

Getting correct DM density

Main Early Universe annihilation mechanisms:

- Annihilation to $W^+ W^-$, effective above 75 GeV
- Annihilation via real or virtual neutral Higgs

like IDM...

Annihilation in the Early Universe

The DM particles can annihilate via the gauge coupling:

$$SSW^+W^- : \quad \frac{ig^2}{2}$$

$$SSZZ : \quad \frac{ig^2}{2\cos^2\theta_W}$$

Annihilation in the Early Universe

The DM particles can annihilate via the gauge coupling:

$$SSW^+W^- : \quad \frac{ig^2}{2}$$

$$SSZZ : \quad \frac{ig^2}{2\cos^2\theta_W}$$

or to non-inert scalars via trilinear

Note

$$SSH_j : \quad -2iF_{SSj}\lambda_L v$$

$$F_{SSj} = \cos\beta R_{j1} + \sin\beta R_{j2}$$

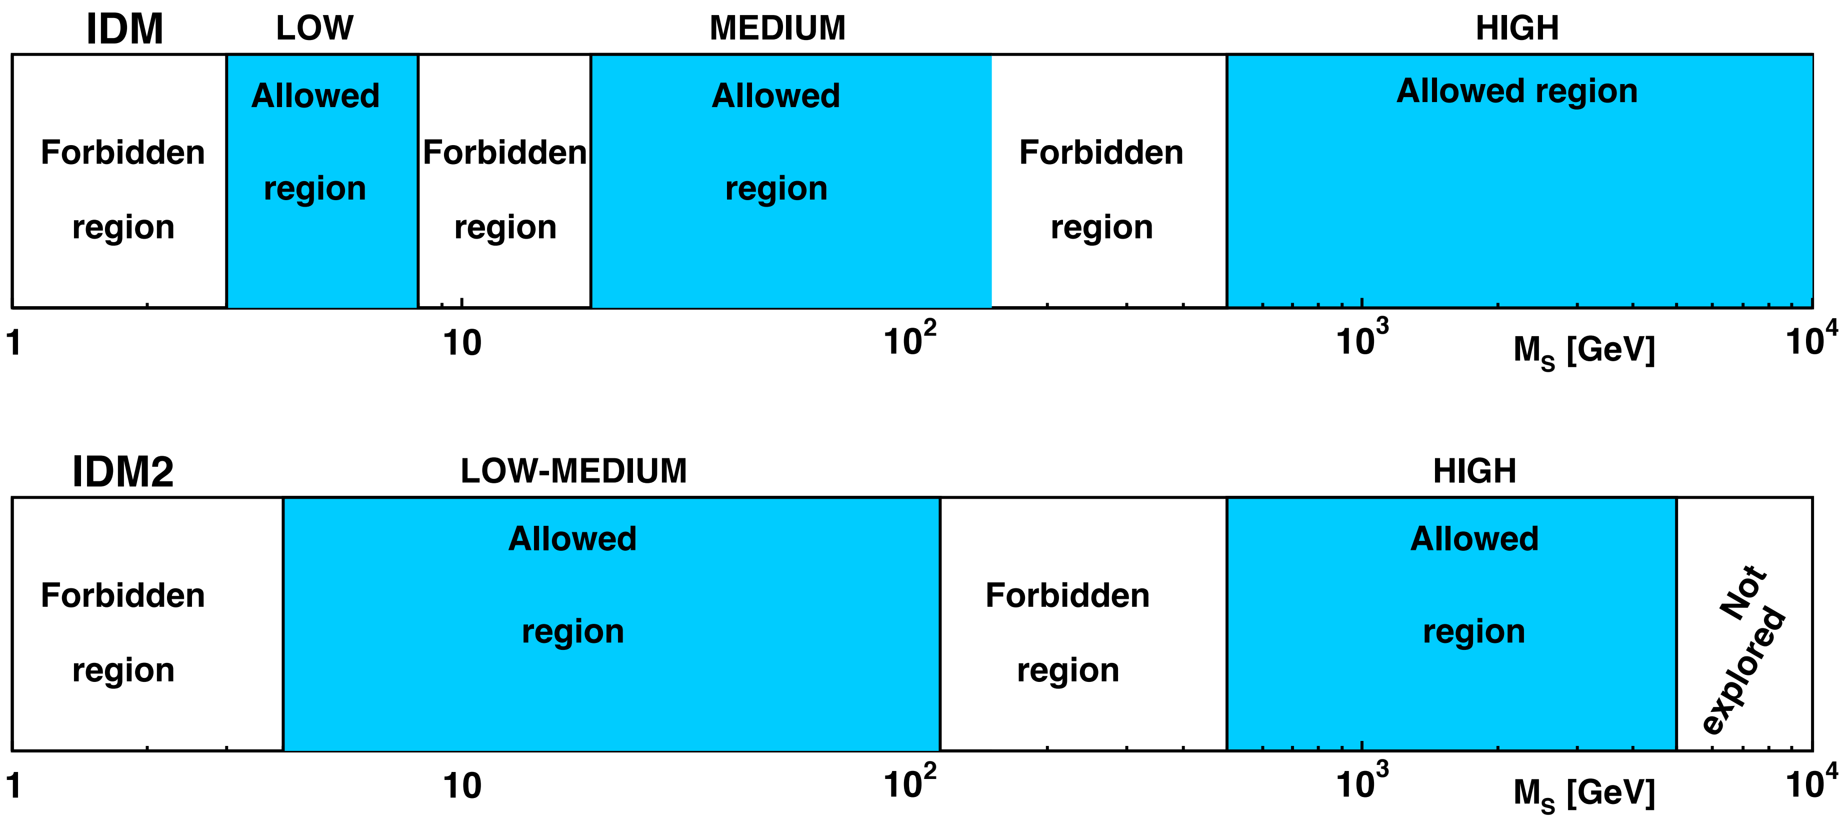
or quartic couplings:

$$SSH_jH_j : \quad -2i(\lambda_L - \lambda_c R_{j3}^2)$$

$$SSH_jH_k : \quad 2i\lambda_c R_{j3}R_{k3}$$

$$SSH^+H^- : \quad -i\lambda_a$$

Allowed regions in M_S



Scan over parameters

1. M_S, M_1 (lowest masses of inert and 2HDM sectors, fixed)
2. M_A, $M_{\eta^\pm}$ (inert sector, physical masses, fixed).
3. M_2, μ (2HDM sector parameters)
4. m_η (inert sector, soft mass parameter, fixed).
5. $\tan\beta$, $M_{H^\pm}$ (2HDM sector),
   $0.5 \leq \tan\beta \leq 50$, $300 \text{ GeV} \leq M_{H^\pm} \leq 700 \text{ GeV}$.
6. α_1, α_2, α_3 (2HDM sector),
   $-\pi/2 \leq \alpha_{1,2} \leq \pi/2$, and $0 \leq \alpha_3 \leq \pi/2$.

Collect results in $M_{\eta^\pm}, m_\eta$ plane

Need some coupling to Higgs, $|\lambda_L|$ can not be too small

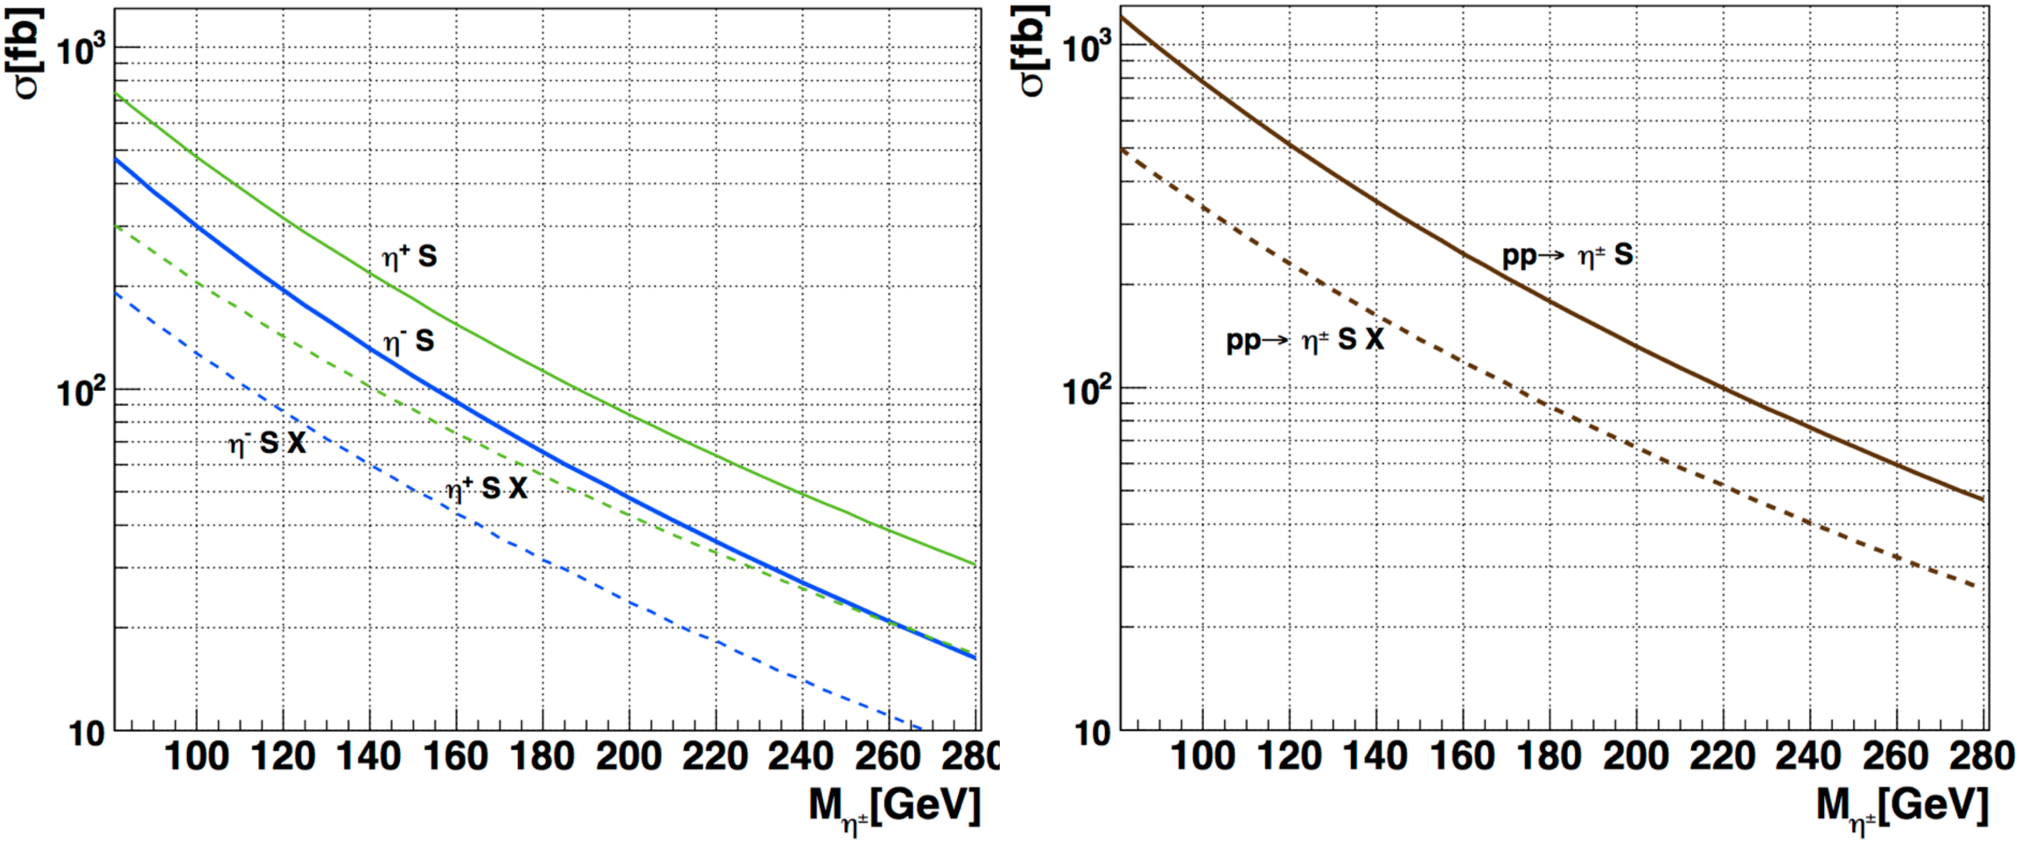
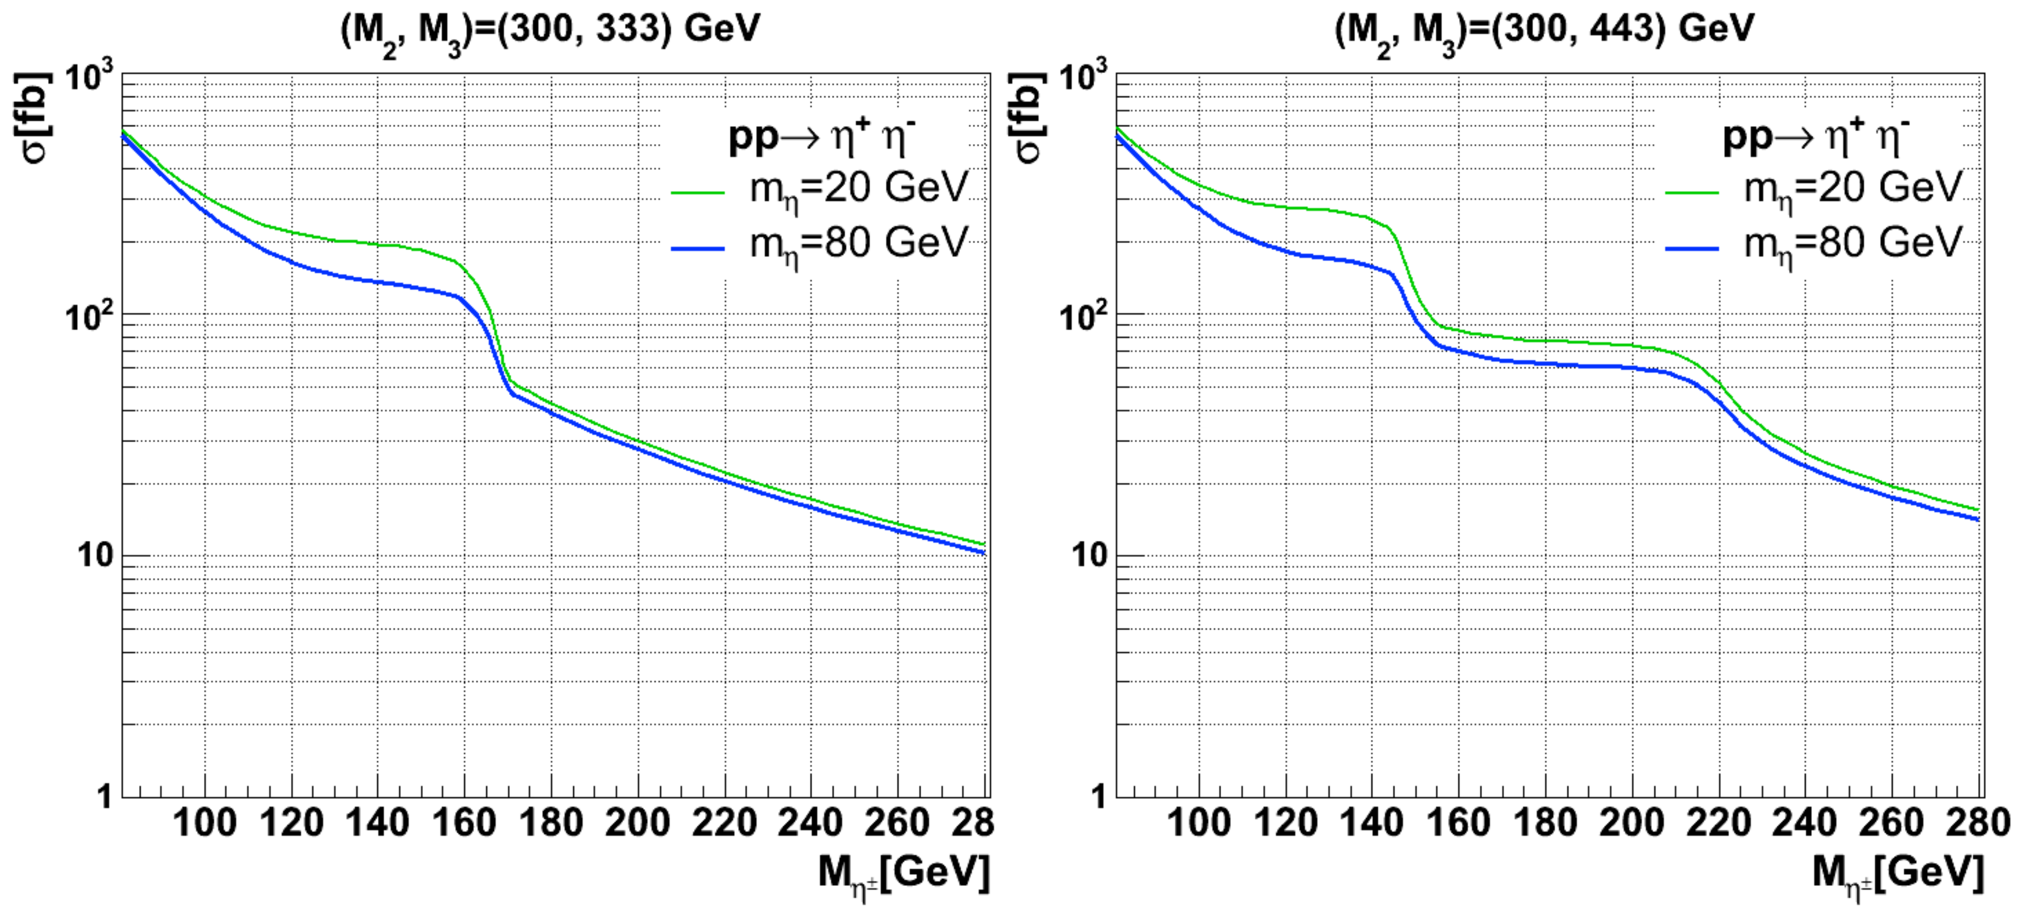
Mη± [GeV]

Single production

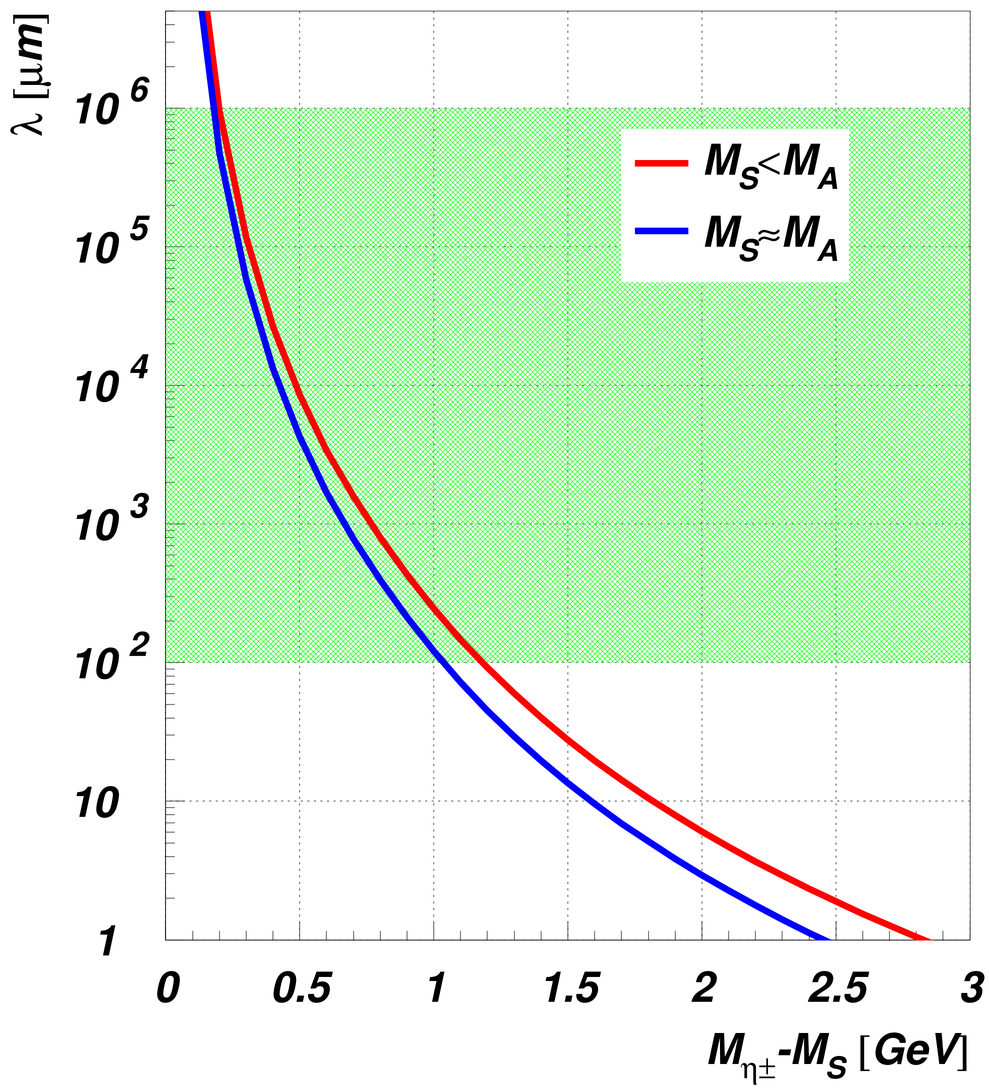


Pair production

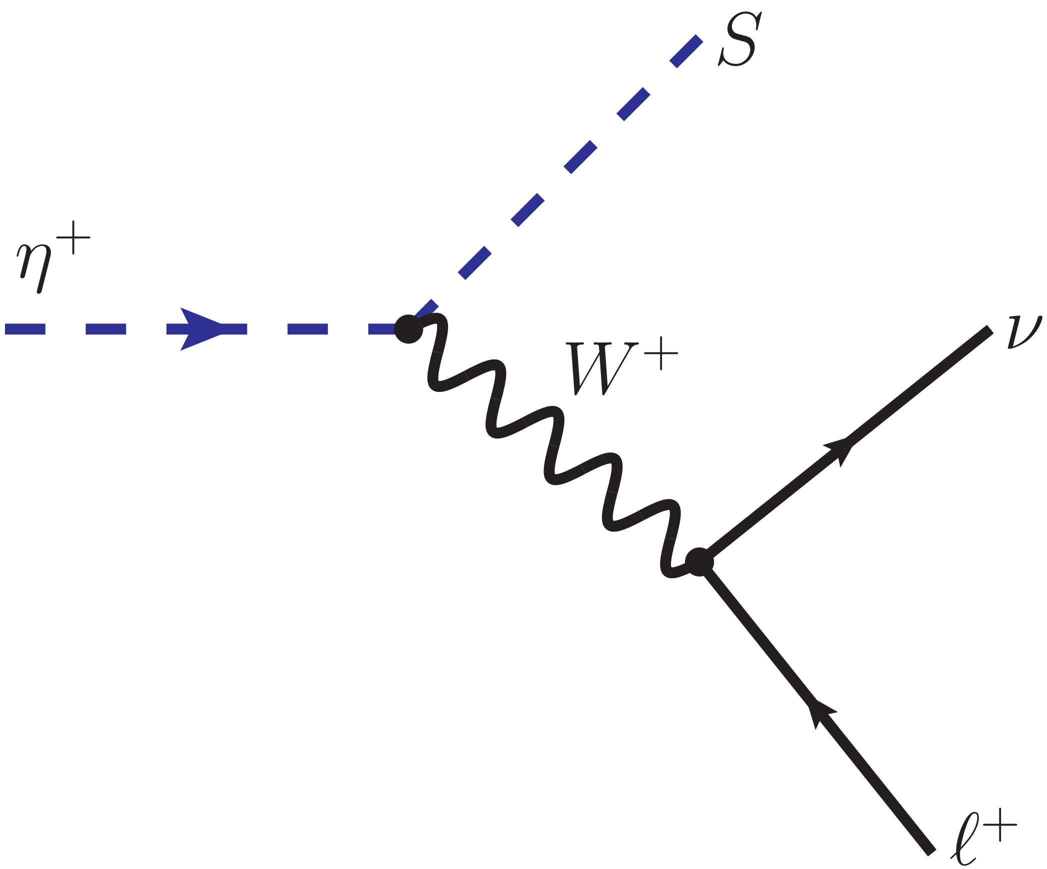


Bumps are due to resonant production via H_2, H_3

For small mass splitting, get displaced vertex



Decay:



For hadronic W decay, get two jets (may merge to one)

Ideas for a search

$$pp \to \eta^{\pm} S \to W^{\pm} S S,$$

$$pp \to j + \mathrm{MET}$$

$$\mathrm{MET} > 120 \ \mathrm{GeV}, \qquad p_j^T > 120 \ \mathrm{GeV}$$

Conclusions

...if scalars are dark matter...

- Scalar sector could be much more exciting than in the SM
- Possibly signals in Direct or Indirect detection experiments
- Possibly interesting signals at the LHC
- In the meantime, parts of parameter space will be excluded
