QFTHEP 2011 - Sochi, Russia - Sep 30 2011

# Recent results from BABAR 

The XXth International Workshop Quantum Field Theory and High Energy Physics

Alejandro Pérez
INFN - Sezione di Pisa
On behalf of the BABAR Collaboration

## Outline

a Introduction

- The experimental environment, BABAR dataset and detector
- Experimental Issues
a Recent highlights
- Branching Fraction (BF) of Hadronic B-decays
> Color-suppressed decays $B^{0} \rightarrow D^{(*)} h^{0}\left(h^{0}=\pi^{0}, \eta, \omega, \eta^{\prime}\right)$
, $\overline{\mathrm{B}}^{0} \rightarrow \Lambda^{+}{ }_{\mathrm{c}} \bar{\Lambda} \mathrm{K}^{-}$
- CP Violation (CPV)
, CPV in $\tau^{-} \rightarrow \pi^{-} \mathrm{K}_{\mathrm{S}}^{0}\left(\mathrm{n} \pi^{0}\right) \nu_{\tau^{\prime}} \mathrm{n}=0,1,2$
> T -odd correlations in $\mathrm{D}^{+} / \mathrm{D}^{+} \rightarrow \mathrm{K}^{+} \mathrm{K}^{0}{ }_{\mathrm{S}} \pi^{+} \pi^{-}$decays
> $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$
- Bottomonium Spectroscopy
, Bottomonium radiative transitions with converted photons ( $\gamma \rightarrow \mathrm{e}^{+} \mathrm{e}^{-}$)
- Conclusions

## BABAR Physics

## 7 Runs over the course of 9 years

- $1^{\text {st }}$ collision May 26, 1999
- Final data taken 12:43 p.m., Apr 2008

Alejandro Pérez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

469 submitted/published papers:
a CPV, CKM angles: $\alpha, \beta, \gamma$
a Semi-Leptonic B decays: $\left|\mathrm{V}_{\mathrm{ub}}\right|,\left|\mathrm{V}_{\mathrm{cb}}\right|$
a $B-B$ mixing: $\left|V_{t d}\right|$

- $\mathrm{D}-\mathrm{D}$ mixing
a Precision measurements, rare decays of B, charm hadrons, $\tau$
a Spectroscopy, discovery of new states
a QCD
a Limits on new physics (NP)

31 publications in 2010

$$

## BABAR Detector

Detection of $\gamma, \mathrm{e}^{-}$identification and $\pi^{0} \rightarrow \gamma \gamma$ reconstruction, Measurements of Energy
Alejandro Pérez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

## Experimental Issues

- Small S/B ratio, mostly continuum ( $e^{+} e^{-} \rightarrow \bar{q} \bar{q}, q \neq b$ ) background.
- Use kinematical and event-shape variables to discriminate:

Beam-energy substituted mass

$$
m_{E S}=\sqrt{E_{\text {beam }}^{*}{ }^{2}-p_{B}^{* 2}}
$$

Energy difference
$\Delta E=E_{B}^{*}-E_{\text {beam }}^{*}$

Event topology
(multivariate methods)

Alejandro Pérez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

## Branching Fraction of Hadronic B Decays

- $\bar{B}^{0} \rightarrow D^{(*) 0} h^{0}, h^{0}=\pi, \eta, \omega, \eta^{\prime}$
- $\bar{B}^{0} \rightarrow \Lambda^{+}{ }_{c} \bar{\Lambda} K^{-}$

## $\bar{B}^{0} \rightarrow D^{(*) 0} h^{0}$ : Motivation

a Neutral $\mathrm{B}^{0} \rightarrow \mathrm{D}\left(^{*}\right)^{0} \mathrm{~h}^{0}$ decays proceed through color-suppressed internal $\mathrm{W}^{ \pm}$diagrams
a Strong interactions in the final state (FSI) can modify decay dynamics

- Perturbative QCD (pQCD)

$$
\begin{aligned}
& \text { e.g. PRD 69, } 094018 \text { (2004), } \\
& \text { PRD 68, } 097502 \text { (2003) }
\end{aligned}
$$

- Soft Collinear Effective Theory (SCET)

$$
\begin{aligned}
& \text { e.g. PRD 65, } 054022 \text { (2002), } \\
& \text { PRD 68, } 114009 \text { (2003), } \\
& \text { PRL 608, } 77 \text { (2005) }
\end{aligned}
$$

a Previous BF measurements seems to disagree with factorization approximation
a Non-factorizable contributions my be dominant for color-suppressed modes
a Stronger experimental constraints needed to distinguish among QCD models (pQCD, SCET, ...)

## $\overline{\mathrm{B}}^{0} \rightarrow \mathrm{D}^{(*) 0} \mathrm{~h}^{0}$ : Strategy

a $D^{(*) 0}$ candidates:

- $D^{0}$ : reconstructed in several modes ( $\mathrm{K}^{-} \pi^{+}, \mathrm{K}^{-} \pi^{+} \pi^{0}, \mathrm{~K}^{-} \pi^{+} \pi^{-} \pi^{+}, \mathrm{K}_{\mathrm{s}}^{0} \pi^{+} \pi^{-}$).

$$
\left|M_{R E C}\left(D^{0}\right)-M_{P D G}\left(D^{0}\right)\right|<-3 \sigma\left(5.0,5.5,6.1,11.0 \mathrm{MeV} / \mathrm{c}^{2}\right)
$$

- $\mathrm{D}^{\star 0}$ : reconstructed in $\mathrm{D}^{\star 0} \rightarrow \mathrm{D}^{0}\left(\pi^{0} / \gamma\right)$. $\left|\mathrm{M}\left(\mathrm{D}^{\star 0}\right)-\mathrm{M}\left(\mathrm{D}^{0}\right)\right|<1 \sigma\left(1.3-7 \mathrm{MeV} / \mathrm{c}^{2}\right)$
a $\mathbf{h}^{0}$ candidates reconstructed in several modes: $\pi^{0} \rightarrow \gamma \gamma, \eta \rightarrow\left(\gamma / / \pi^{+} \pi^{-} \pi^{0}\right)$,
$\omega \rightarrow \pi^{+} \pi^{-} \pi^{0}, \eta^{\prime} \rightarrow\left(\rho^{0} \gamma / \pi^{+} \pi^{-} \eta(\rightarrow \gamma \gamma)\right)$. Mass window depends on resolution
a $\mathbf{B}^{0}$ candidates:
- A total of 72 modes counting all $\mathrm{D}^{(*)} \mathrm{h}^{0}$ combinations
- Signal window $m_{E S}>5.27 \mathrm{GeV} / \mathrm{C}^{2}$
a Use Fisher to further reduce continuum qq background
a $B^{-} \rightarrow D^{(*)} h^{-}\left(h^{-}=\pi^{-}, \rho^{-}\right.$, as control sample (Data vs MC comparison)
a Signal yields extracted with unbinned maximum likelihood fit to $\Delta \mathrm{E}$ variable
a Cross-feed between $B^{0} \rightarrow D^{* 0} h^{0} \Leftrightarrow B^{0} \rightarrow D^{0} h^{0}$ modes estimated with iterative procedure

## $\bar{B}^{0} \rightarrow D^{(*) 0} h^{0}$ : Results (I)

## $\bar{B}^{0} \rightarrow \mathrm{D}^{0} \mathrm{~h}^{0}$ modes

a For every $\mathrm{h}^{0}=\pi^{0}$, $\eta, \omega, \eta$ ' mode the plot show the measurement integrated on the $\mathrm{D}^{0}$ modes ( $\mathrm{K}^{-} \pi^{+}$, $\mathrm{K}^{-} \pi^{+} \pi^{0}, \mathrm{~K}^{-} \pi^{+} \pi^{-} \pi^{+}$, $\mathrm{K}_{\mathrm{s}}^{0} \pi^{+} \pi^{-}$)

- Signal yields are extracted with significances above $5 \sigma$

Data Sample: $454 \times 10^{6}$ B $\bar{B}$

#  

$\overline{\mathbf{B}}^{0} \rightarrow \mathrm{D}^{* 0} \mathbf{h}^{0}$ modes

Data Sample:
$454 \times 10^{6}$ B $\bar{B}$

## $\overline{\mathbf{B}}^{0} \rightarrow \mathrm{D}^{(*)} \mathrm{h}^{0}$ : Results (Illi)

a BFs consistent with previous measurements
a $\mathrm{BF}\left(\mathrm{B}^{0} \rightarrow \mathrm{D}^{* 0} \mathrm{~h}^{0}\right) / \mathrm{BF}\left(\mathrm{B}^{0} \rightarrow \mathrm{D}^{0} \mathrm{~h}^{0}\right)$ consistent with 1.0 (within $30 \%$ ) as expected by SCET but disagrees with pQCD

| $B A B A R$ Preliminary |  |
| :--- | :--- |
| $\mathcal{B}\left(\bar{B}^{0} \rightarrow\right)\left(\times 10^{-4}\right)$ | This measurement |
| $D^{0} \pi^{0}$ | $2.69 \pm 0.09 \pm 0.13$ |
| $D^{* 0} \pi^{0}$ | $3.05 \pm 0.14 \pm 0.28$ |
| $D^{0} \eta$ | $2.53 \pm 0.09 \pm 0.11$ |
| $D^{* 0} \eta$ | $2.69 \pm 0.14 \pm 0.23$ |
| $D^{0} \omega$ | $2.57 \pm 0.11 \pm 0.14$ |
| $D^{* 0} \omega$ | $4.55 \pm 0.24 \pm 0.39$ |
| $D^{0} \eta^{\prime}$ | $1.48 \pm 0.13 \pm 0.07$ |
| $D^{* 0} \eta^{\prime}$ | $1.48 \pm 0.22 \pm 0.13$ |

$00.20 .40 .60 .811 .21 .41 .61 .8{ }^{2} 2.2$
$\mathrm{BF}\left(\mathrm{B}^{-4} \rightarrow \mathrm{D}^{+0} \mathrm{~h}^{0}\right) / \mathrm{BF}\left(\mathrm{B}^{\mathrm{o}} \rightarrow \mathrm{D}^{0} \mathrm{~h}^{0}{ }^{0}\right)$
a Measure $f_{L}$ for $\mathrm{B}^{0} \rightarrow \mathrm{D}^{\star 0} \omega$ mode for the first time!

$$
f_{L}=\left(66.5 \pm 4.7_{\text {stat }} \pm 1.5_{\text {syst }}\right) \%
$$

a Much lower value than HQET predictions

$$
f_{L}=(89.5 \pm 1.9) \% \text { e.g. PRD 42, } 3732 \text { (1990), PRL 264, } 455 \text { (1991) }
$$

Alejandro Pérez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

## $\overline{\mathrm{B}}^{0} \rightarrow \mathbf{\Lambda}^{+}{ }_{\mathrm{c}}^{\mathbf{A}} \mathrm{K}^{-}$: Motivation

- $\mathrm{BF}(\mathrm{B} \rightarrow$ baryons $) \sim 7 \%$, but sum of known modes accounts only $\sim 1 \%$
a $B \rightarrow$ baryons poorly understood theoretically $\Rightarrow$ study of as many exclusive modes as possible can help to understand the decay mechanism
a Threshold enhancement in bayon-antibaryon mass has been observed
a $\mathrm{B} \rightarrow$ baryons may provide evidence of new/poorly known resonances

## $\overline{\mathcal{B}}^{0} \rightarrow \mathrm{~A}^{+}{ }_{\mathrm{c}} \bar{\Lambda}^{-}$: Strategy

a $\Lambda^{+}{ }_{\mathrm{c}}$ candidates: $\Lambda_{\mathrm{c}}^{+} \rightarrow \mathrm{pK}^{-} \pi^{+}$. Vertexing, $2.273<\mathrm{M}\left(\Lambda^{+}{ }_{\mathrm{c}}\right)<2.299 \mathrm{GeV} / \mathrm{c}^{2}$
a $\bar{\Lambda}$ candidates: $\bar{\Lambda} \rightarrow \overline{\mathrm{p}} \pi^{+}$. Vertexing, $1.113<\mathrm{M}(\mathrm{L})<1.119 \mathrm{GeV} / \mathrm{c}^{2}$

- $\mathbf{B}^{0}$ candidates:
- Mass constraint ( $\Lambda^{+}$mass fixed to PDG) of $\Lambda_{c}^{+} \Lambda K^{-}$to same vertex
- Signal window $5.272<\mathrm{m}_{\mathrm{ES}}<2.288 \mathrm{GeV} / \mathrm{c}^{2}$
a Distance between B and $\bar{\Lambda}$ vertexes in xy plane $>0.4 \mathrm{~cm}$
- Rejection of $99.6 \%$ of $\overline{\mathrm{B}}^{0} \rightarrow \Lambda^{+}{ }_{\mathrm{c}} \overline{\mathrm{p}}^{-} \pi^{+}$background
- Rejection of $18.0 \%$ of combinatoric background
a Signal yield extracted with binned maximum likelihood fit to $\Delta \mathrm{E}$ variable
a In the BF measurement, efficiency is corrected accounting for the phase-sapce distribution (two-body invariant masses) observed on data

## $\overline{\mathcal{B}}^{0} \rightarrow \Lambda^{+}{ }_{c} \overline{\mathbf{A}} \mathrm{~K}^{-}$: Results

$\Lambda^{+}{ }_{\mathrm{c}}{ }^{\bar{\Lambda}}$

Signal Yield: $51 \pm 9$ events , $\sim 8 \sigma$ significance

$$
\mathrm{BF}\left(\overline{\mathrm{~B}^{0}} \rightarrow \Lambda_{\mathrm{c}}^{+} \overline{\bar{\Lambda}} \mathrm{K}^{-}\right)=\left(3.8 \pm 0.8_{\text {stat }} \pm 0.2_{\text {syst }} \pm 1.0_{\Lambda c}\right) \times 10^{-5}
$$

a Within signal region look at all combinations of 2-body invariant masses of the $\mathrm{B}^{0} \rightarrow \Lambda^{+}{ }_{\mathrm{c}} \Lambda \mathrm{K}^{-}$ final state. Enhancement at high $\left(\Lambda^{+} \mathrm{K}^{-}\right)$mass arXiv: 1107.5751
Submitted to PRD
Alejandro Pérez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

## CP Violation

- CPV in $\tau^{-} \rightarrow \pi^{-} K_{s}^{0}\left(n \pi^{0}\right) v_{\tau}, n=\mathbf{0 , 1 , 2}$
- T-odd correlations in $\mathrm{D}^{+} / \mathrm{D}^{+}{ }_{\mathrm{s}} \rightarrow \mathrm{K}^{+} \mathrm{K}_{\mathrm{s}}^{0} \pi^{+} \pi^{-}$
- $\mathbf{B}^{+} \rightarrow \mathbf{K}^{+} \pi^{0} \pi^{0}$

## CPV in $\tau^{-} \rightarrow \pi^{-} \mathbb{K}_{s}^{0}\left(n \pi^{0}\right) v_{\tau}:$ Motivation

a Standard Model (SM) predicts no CPV in $\tau^{-} \rightarrow \pi^{-} \overline{\mathrm{K}}^{0} \nu_{\tau}$ decays
a CPV in the Kaon sector induces a nonzero $A_{C P}$ on the $\tau^{-} \rightarrow \pi^{-} \mathrm{K}_{\mathrm{s}}^{0} \nu_{\tau}$ final state
$\mathrm{A}_{\mathrm{CP}}=\frac{\Gamma\left(\tau^{+} \rightarrow \pi^{+} \mathrm{K}_{\mathrm{s}}^{0} \bar{v}_{\tau}\right)-\Gamma\left(\tau^{-} \rightarrow \pi^{-} \mathbf{K}_{\mathrm{s}}^{0} v_{\tau}\right)}{\Gamma\left(\tau^{+} \rightarrow \pi^{+} \mathrm{K}_{\mathrm{s}}^{0} \bar{v}_{\tau}\right)+\Gamma\left(\tau^{-} \rightarrow \pi^{-} \mathrm{K}^{0}{ }_{\mathrm{s}}{ }_{\tau}\right)}$

a $\quad \mathrm{SM}$ prediction $\mathrm{A}^{\mathrm{SM}}{ }_{\mathrm{CP}}=(0.332 \pm 0.006) \%$ PLB 625, 47 (2005)

- A deviation of the measured $A_{C P}$ from $A^{S M}{ }_{C P}$ would be a hint of NP
- e.g. an additional CPV phase from Charged Higgs boson PLB 398, 407 (1997)
a Additional $\pi^{0}$ s in the final state are not expected to change the $A_{C P}$
- Can consider the modes $\tau^{-} \rightarrow \pi^{-} K^{0}{ }_{s}\left(n \pi^{0}\right) \nu_{\tau^{\prime}}$, with $n=0,1,2$

## CPV in $\tau^{-} \rightarrow \pi^{-} \mathbb{K}_{5}^{0}\left(n \pi^{0}\right) v_{\tau}$ : Strategy

- Leptonic tag technique very useful to reduce backgrounds
a Tag-side: only hard leptons (e, $\mu$ )
- $p^{*}>4.0 \mathrm{GeV} / \mathrm{c}$ (rejects non- $\tau$ decays backgrounds)
a Signal-side:
- $\mathrm{M}\left(\pi^{-} \mathrm{K}_{\mathrm{s}}^{0}\left(\mathrm{n} \pi^{0}\right)\right)<1.8 \mathrm{GeV} / \mathrm{c}^{2}$

(rejects $q \bar{q}$ backgrounds)
- Likelihood ration to reduce remaining backgrounds $\mathrm{q} \overline{\mathrm{q}}$ : visible energy, \# neutral clusters, Thrust , total $p_{T}$
$\mathrm{K}_{\mathrm{s}}^{0}$ : displaced vertex, $\mathrm{M}\left(\mathrm{K}_{\mathrm{s}}^{0}\right)$, momentum and $\theta$ of $\mathrm{K}_{\mathrm{s}}^{0}$ candidate

## CPV in $\tau^{-} \rightarrow \pi^{-} \mathbb{K}_{5}^{0}\left(n \pi^{0}\right) v_{\tau}$ : Results

- Measure raw $A_{C P}$ after subtracting continuum $\mathrm{q} \bar{q}$ and non $-\mathrm{K}_{\mathrm{s}}^{0} 437 \times 10^{6} \tau^{+} \tau^{-}$ $\tau$-decays. Raw $\mathrm{A}_{\mathrm{CP}}$ corrected by
- Different $\mathrm{K}^{0} / \bar{K}^{0}$ interactions with material ( $0.14 \pm 0.03$ ) $\%$ for e-tag and ( $0.14 \pm 0.02$ ) $\%$ for $\mu$-tag
- Dilution from backgrounds modes with $\mathrm{A}_{\mathrm{CP}}$ different than signal

| Source | Fractions (\%) |  | BABAR Preliminary |
| :---: | :---: | :---: | :---: |
|  | $e$-tag | $\mu$-tag |  |
| $\tau^{-} \rightarrow \pi^{-} K_{S}^{0}\left(>0 \pi^{0}\right) \nu_{\tau}$ | $78.4 \pm 4.0$ | $77.4 \pm 4.0$ |  |
| $\tau^{-} \rightarrow K^{-} K_{S}^{0}\left(\geq 0 \pi^{0}\right) \nu_{\tau}$ | $4.2 \pm 0.3$ | $4.0 \pm 0.3$ |  |
| $\tau^{-} \rightarrow \pi^{-} K^{0} \bar{K}^{0} \nu_{\tau}$ | $15.6 \pm 3.7$ | $15.7 \pm 3.7$ | $A^{\text {Sm }}$ |

## Result:

$A_{c p}\left(\tau^{-} \rightarrow \pi^{-} K_{s}^{0}\left(n \pi^{0}\right) \nu_{\tau}\right)=\left(-0.45 \pm 0.24_{\text {stat }} \pm 0.11_{\text {syst }}\right) \%$
arXiv: 1109.1527 Submitted to PRD

## CPV in $D^{+} / D_{s}^{+} \rightarrow K^{+} K_{s}^{0} \pi^{+} \pi^{-}:$Motivation

a Direct CPV in D decays:

- CKM suppressed in SM O(10 $\left.{ }^{-3}\right)$. NP can increase/reduce effect
- Current experimental precision $\mathrm{O}\left(10^{-3}\right)$
a New strategy based on Bigi hep-ph/0107102
a CPT invariance: T-violation $\Rightarrow$ CPV
a Define T-odd observable
$C_{T} \equiv \overrightarrow{\mathrm{p}}_{\mathrm{K}^{+}} \cdot\left(\overrightarrow{\mathrm{p}}_{\pi^{+}} \times \overrightarrow{\mathrm{p}}_{\pi^{-}}\right)$

a Build the following asymmetries

$$
\begin{array}{cc}
A_{T}=\frac{\Gamma\left(C_{T}>0\right)-\Gamma\left(C_{T}<0\right)}{\Gamma\left(C_{T}>0\right)+\Gamma\left(C_{T}<0\right)} & \bar{A}_{T}=\frac{\Gamma\left(\bar{C}_{T}>0\right)-\Gamma\left(\bar{C}_{T}<0\right)}{\Gamma\left(\bar{C}_{T}>0\right)+\Gamma\left(\bar{C}_{T}<0\right)} \\
\text { Measured on } \mathrm{D}_{(\mathrm{s})}^{+} & \text {Measured on } \mathrm{D}_{(\mathrm{s})}^{-}
\end{array}
$$

a Final state interaction (FSI) may induce T-odd asymetries $A_{T} \neq 0$

- Remove FSI effects by measuring A T-violation observable

$$
\mathcal{A}_{T} \equiv 1 / 2\left(A_{T}-\bar{A}_{T}\right)
$$

## CPV in $D^{+} / D_{s}^{+} \rightarrow K^{+} K_{s}^{0} \pi^{+} \pi^{-}$: Strategy

- Inclusive $\mathrm{D}_{(\mathrm{s})}^{+}$reconstruction

Data Sample:
$\mathrm{e}^{+} \mathrm{e}^{-} \rightarrow \mathrm{XD}^{+}{ }_{(s)} ; \mathrm{D}^{+}{ }_{(\mathrm{s})} \rightarrow \mathrm{K}^{+} K^{0}{ }_{s} \pi^{+} \pi^{-} ; K^{0}{ }_{s} \rightarrow \pi^{+} \pi^{-}$
a $\mathrm{p}^{*}\left(\mathrm{D}_{(\mathrm{s})}^{+}\right)>2.5 \mathrm{GeV} / \mathrm{c}$

- $\mathrm{CM} \mathrm{p}^{*}\left(\mathrm{D}^{+}{ }_{(\mathrm{s})}\right)$
- Vertexing probability difference $P_{1}-P_{2}$

$$
P_{1} \equiv 4 \text { particle vertex }
$$

$\mathrm{P}_{2} \equiv$ primary vertex
Alejandro Pérez, QFTHEP 2011 Sochi, Russia

## $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ : Motivation

a $\quad$ Expected $A_{c p}\left(\mathrm{~K}^{+} \pi^{-}\right) \approx A_{c p}\left(\mathrm{~K}^{+} \pi^{0}\right)$
a Experiment finds

$$
\begin{gathered}
\left.\begin{array}{c}
A_{C P}\left(\mathrm{~K}^{+} \pi^{0}\right)=+0.050 \pm 0.025 \\
A_{C P}\left(\mathrm{~K}^{+} \pi^{-}\right)=-0.098 \pm 0.012
\end{array}\right\} \begin{array}{l}
\text { 5c difference } \\
\text { "K } \pi \text { puzzle" } \\
\text { SM o NP? }
\end{array} \\
\text { Mod. Phys. Let. A 24, } 1983(2009)
\end{gathered}
$$

a Large hadronic uncertainties in $\mathrm{SM} \Rightarrow$ no clear interpretation in terms of NP

a Larger Tree/Penguin ratio expected for $\mathrm{B} \rightarrow \mathrm{K}^{*} \pi / \mathrm{K} \rho$ modes $\Rightarrow$ Larger CP asymmetries
a Is there a similar puzzle in the $\mathrm{B} \rightarrow \mathrm{K}^{*} \pi$ system? Need to compare $A_{C P}\left(\mathrm{~K}^{\star+} \pi^{-}\right) \approx A_{C P}\left(\mathrm{~K}^{*+} \pi^{0}\right) . \mathrm{K}^{*+} \pi^{0}$ contributes to $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$
a Dominant contributions to $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ Dalitz plot may help clarify interpretation of inclusive time-dependent CP-asymmetry of $\mathrm{B}^{0} \rightarrow \mathrm{~K}_{\mathrm{s}}^{0} \pi^{0} \pi^{0}$.
SM expects $S_{C P}\left(\mathrm{~B}^{0} \rightarrow \mathrm{~K}^{0} \pi^{0} \pi^{0}\right)=-\sin (2 \beta)$

## $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ : Strategy

a $\pi^{0} \rightarrow \gamma \gamma .115<\mathrm{M}\left(\pi^{0}\right)<150 \mathrm{MeV} / \mathrm{c}^{2}$
a $\mathrm{B}^{+}$: mass constraint ( $\pi^{0}$ mass fixed to PDG) fit of $\mathrm{K}^{+} \pi^{0} \pi^{0}$ to same vertex
a $\Delta$ E correlated with Dalitz Plot (DP) $\Rightarrow$ not used in the fit. Signal window $-150<\Delta \mathrm{E}<50 \mathrm{MeV}$

a Veto: $0.40<\mathrm{M}\left(\pi^{0} \pi^{0}\right)<0.55 \mathrm{GeV} / \mathrm{c}^{2}$ to exclude $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \mathrm{K}_{\mathrm{s}}^{0}\left(\rightarrow \pi^{0} \pi^{0}\right) \quad \mathrm{m}_{\pi^{0}}\left(\mathrm{GeV} / \mathrm{c}^{2}\right)$ Background (rejects $96 \%$ and keeps $\sim 100 \%$ of signal)
a Use Neural Net $\left(\mathrm{NN}_{\text {out }}\right)$ to further reduce continuum $\bar{q} \bar{q}$ background. Apply loose cut $\mathrm{NN}_{\text {out }}>0.3 \Rightarrow$ rejects (keeps) $82 \%$ (90\%) of continuum (signal)

- Signal yield and global $A_{C P}$ extracted with unbinned maximum likelihood fit to $\mathrm{m}_{\text {ES }}$ and $\mathrm{NN}_{\text {out }}$ variables
a Fraction of self-cross-feed (SCF) events strongly dependent on DP. Iterative method to estimate SCF fraction using sPlots NIM A555, 356 (2005)

## $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ : Results (I)

## To be submitted to PRD

Inclusive $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ measurement:
a Convergence after 4 iterations $\Rightarrow$ Signal Yield $=1220 \pm 85$ and $f_{\text {SCF }}=9.7 \%$
a $10 \sigma$ significance including systematic effects!

- $\mathrm{BF}\left(\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}\right)=\left(16.2 \pm 1.2_{\text {stat }} \pm 1.5_{\text {syst }}\right) \times 10^{-5}$
a $\quad A_{C P}\left(\mathrm{~B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}\right)=\left(-6.0 \pm 6.0_{\text {stat }} \pm 4.0_{\text {syst }}\right) \%$

## $\mathrm{B}^{+} \rightarrow \mathbb{K}^{+} \pi^{0} \pi^{0}$ : Results (III)

Quasi-two-body contributions:
a Use sPlot technique to obtain DP distributions from $\mathrm{m}_{\mathrm{ES}}-\mathrm{NN}_{\text {out }}$ fit.
Project DP onto the 2-body invariant masses
a Signal peaks from $\mathrm{K}^{\star}(892)^{+} \pi^{0}, \mathrm{f}_{0}(980) \mathrm{K}^{+}, \chi_{\mathrm{co}} \mathrm{K}^{+}$are clearly seen
a Broad peak at $\sim 1400 \mathrm{MeV} / \mathrm{c}^{2}$ in the $\mathrm{K}^{+} \pi^{0}$ mass, possibly from $\mathrm{K}^{*}{ }_{0 / 2}(1430)^{+} \pi^{0}$
a No enhancement from $f_{x}(1300)$ in pipi mass. Deap at $\sim 1500 \mathrm{MeVc}^{2}$
a BF and $\mathrm{A}_{\mathrm{CP}}$ extracted from fit to 2-body invariant masses around resonant

## $\mathrm{B}^{+} \rightarrow \mathbf{K}^{+} \pi^{0} \pi^{0}$ : Results (IIII)

## To be submitted to PRD

Data Sample: $471 \times 10^{6}$ B $\bar{B}$
a First inclusive measurement of $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \pi^{0}$ !
a More statistics is needed to better test $A_{C P}\left(\mathrm{~K}^{*+} \pi^{-}\right) \approx A_{C P}\left(\mathrm{~K}^{*+} \pi^{0}\right)$

| Mode | $\mathcal{B}\left(B^{+} \rightarrow R h \rightarrow K^{+} \pi^{0} \pi^{0}\right)$ | $\mathcal{B}\left(B^{+} \rightarrow R h\right)$ | $A_{C P}$ |
| :--- | :---: | :---: | :---: |
| $B^{+} \rightarrow K^{+} \pi^{0} \pi^{0}$ | $(16.2 \pm 1.2 \pm 1.5) \times 10^{-6}$ | $\cdots$ | $-0.06 \pm 0.06 \pm 0.04$ |
| $B^{+} \rightarrow K^{*}(892)^{+} \pi^{0}$ | $(2.7 \pm 0.5 \pm 0.4) \times 10^{-6}$ | $(8.2 \pm 1.5 \pm 1.1) \times 10^{-6}$ | $-0.06 \pm 0.24 \pm 0.04$ |
| $B^{+} \rightarrow f_{0}(980) K^{+}$ | $(2.8 \pm 0.6 \pm 0.5) \times 10^{-6}$ | $\cdots$ | $0.18 \pm 0.18 \pm 0.04$ |

To be compared with
$A_{C P}\left(K^{+} \pi^{-}\right)=-0.25 \pm 0.07 \pm 0.02$

## Bottomonium Spectroscopy

- Bottomonium (b̄ ) radiative transitions with $\gamma \rightarrow \mathrm{e}^{+} \mathrm{e}^{-}$

## The bb̄ Spectrum: Introduction

- Studies of b̄b (bottomonium) and $\bar{c} \bar{c}$ (charmonium) bound states provide insight about inter-quark forces
- Searches of predicted states (Not discussed here)
- Discovery and confirmation of the bottomonium ground state ( $\mathrm{L}=0, \mathrm{~S}=0$ ) $\eta_{b}(1 S)$ after 30 years of hunting
- Searches of the $h_{b}(1 P)$ state to understand hyperfine mass-splitting of P -wave states
a Study of radiative transitions (This talk)
- Measurement of electric (E1) and magnetic (M1) transition rates
- Better understanding of modeldependencies of inter-quark potential
- Useful spectroscopic studies of mass measurements

## bb transitions using $\gamma \rightarrow e^{+} e^{-}$: Motivation

a Bottomonia radiative transitions well described by effective potential models (non-relativistic)
a Higher-order relativistic and model-dependent effects may play substantial role in suppressed radiative transitions (e.g. E1 $\Upsilon(3 S) \rightarrow \gamma \chi_{b j}$ (1P) and "hindered" M1 $\mathrm{r}(\mathrm{nS}) \rightarrow \eta_{\mathrm{b}}(\mathrm{n}$ S $)$ )
a Doppler broadening and detector resolution (EMC) may lead to unresolved radiated photon energies from different transitions
a Want to separate the individual contributions for more precise mass-splitting measurements
a Use converted photons ( $\gamma \rightarrow \mathrm{e}^{+} \mathrm{e}^{-}$) in detector material
a Pros: lower resolution $(\sim 5 \mathrm{MeV})$ than EMC detected $\gamma(\sim 25 \mathrm{MeV})$
a Cons: decreased efficiency (0.1-2.5\%)

## $\overline{\text { bbb }}$ transitions using $\gamma \rightarrow e^{+} e^{-}$: Strategy

a Selection

- $N_{\text {tracks }}$ and distribution $\left(\left|\cos \left(\theta_{\text {trruss }}\right)\right|\right)$ consistent with a multi-hadron event
- Good photon conversion candidate: $\chi^{2}$ fit, $m\left(\mathrm{e}^{+} \mathrm{e}^{-}\right), \rho_{\gamma}$ and $\pi^{0}$ veto
a Fit to CM photon energy spectrum ( $\mathrm{E}^{*}$ ) in four different regions
- IV. Y(3S): $180<\mathrm{E}^{*}<300 \mathrm{MeV}$.
$\chi_{\mathrm{b},}(2 \mathrm{P}) \rightarrow \gamma \mathrm{r}(2 \mathrm{~S})$
- V. $\mathrm{r}(3 \mathrm{~S}): 300<\mathrm{E}_{\gamma}^{*}<600 \mathrm{MeV}$. $\Upsilon(3 S) \rightarrow \gamma \chi_{b 2}(1 \mathrm{P})$ and $\mathrm{r}(3 \mathrm{~S}) \rightarrow \mathrm{m}_{b}(2 \mathrm{~S})$
- VII. Y(3S): $600<\mathrm{E}^{\star}{ }_{\gamma}<1100 \mathrm{MeV}$. $\chi_{\mathrm{n},}(2 \mathrm{P}) \rightarrow \gamma \mathrm{r}(1 \mathrm{~S})$ and $\mathrm{r}(3 \mathrm{~S}) \rightarrow \gamma \eta_{\mathrm{n}}(1 \mathrm{~S})$
- VI. Y(2S): $300<\mathrm{E}^{*}<800 \mathrm{MeV}$.
$\chi_{\mathrm{v}}(1 \mathrm{P}) \rightarrow \gamma \mathrm{r}(1 \mathrm{~S})$ and $\mathrm{r}(2 \mathrm{~S}) \rightarrow \gamma \eta_{\mathrm{p}}(1 \mathrm{~S})$
Alejandro Perez, QFTHEP 2011 Sochi, Russia. Sep 30th 2011

## Conclusions

- BABAR last data collected in 2008, but collaboration still very active
- Many results (over 100 ongoing analyses) on a variety of topics
- BABAR continues to produce interesting and competitive results
- Stay tuned for more results
